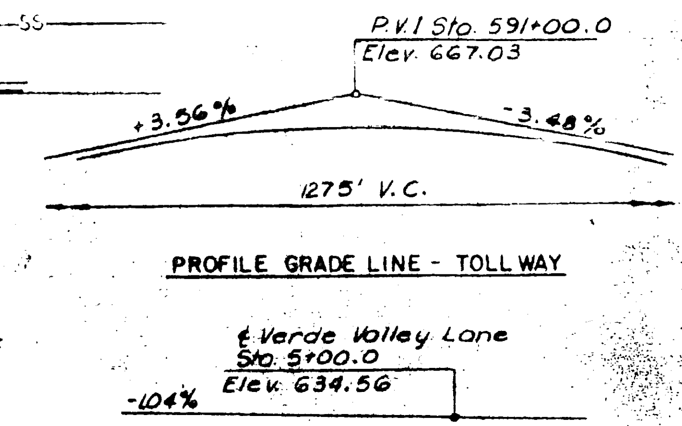
NOTE:
Subsurface information shown on this drawing was obtained solely for use in establishing design controls for the project. The accuracy of this information is not guaranteed and it is not to be construed as part of the plans and specifications governing construction of the project. It is the Bidder's responsibility to inquire of the particular section engineer on any section to be bid as to whether additional information is available and to make arrangements to review same prior to bidding. Each Bidder is responsible for making his own determinations as to all subsurface conditions and limits.

NOTE:
The information shown on this drawing concerning type and location of underground utilities is not guaranteed to be accurate or all inclusive. The Contractor is responsible for making his own determinations as to type and location of underground utilities as may be necessary to avoid damage thereto. The Contractor shall verify location of underground pipe lines, conduits, and structures by contacting owners of underground utilities and by prospecting in advance of excavation operations.



PROFILE GRADE LINE - TOLLWAY

PROFILE GRADE LINE - VERDE VALLEY LANE

GENERAL NOTES.

DESIGNED ACCORDING TO AASHTO 1977 STANDARD AND INTERIM SPECIFICATIONS THRU 1982 FOR HS20-44 LOADING

BRIDGE PROTECTIVE ASSEMBLIES SHALL BE ATTACHED TO THE OUTSIDE FACE OF EXTERIOR BEAMS TO POINTS 6-INCHES BEYOND THE LIMITS OF THE ROADWAY AT THE LOCATIONS SHOWN. FOR DETAILS, SEE STANDARD DRAWING NO. 29.

FOR DETAILS OF CONCRETE RIPRAP, SEE STANDARD DRAWINGS NO. 20 & 21.

FOR APPROACH SLAB DETAILS, SEE STANDARD DRAWING NO. 22.

FOR TRAFFIC RAIL AND TRAFFIC BARRIER DETAILS, SEE STANDARD DRAWINGS NO. 30, 31, & 32.

ALL DIMENSIONS ARE HORIZONTAL OR VERTICAL AND MUST BE CORRECTED FOR GRADE, CROWN, AND/OR SUPERELEVATION.

BENCHMARK DATA

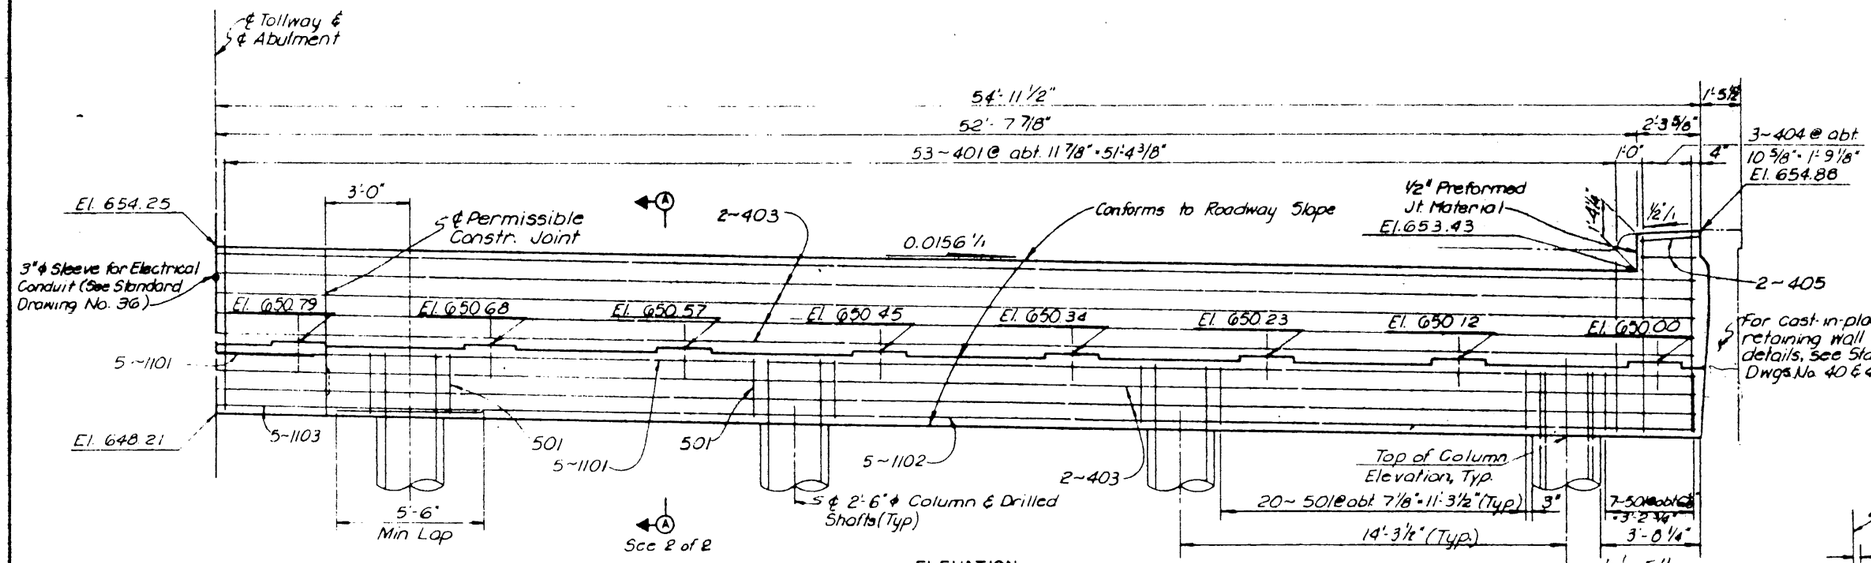
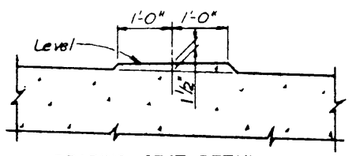
PLAN
Scale: 3/8" = 1'-0"

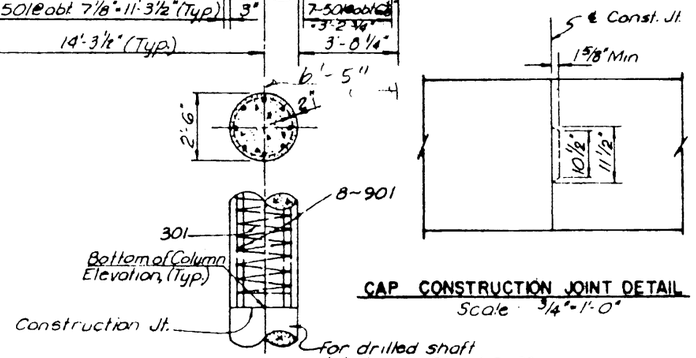


ELEVATION
Scale: 3/8" = 1'-0"



BEARING SEAT DETAIL
Scale: 3/4" = 1'-0"

Note:
Built-up portions of bearing seat shall be cast integrally with cap or constructed as follows: The area under the built-up portion is to be prepared in accordance with specification requirements for construction joints. The pedestal shall then be placed using an approved pre-packaged, non-shrink, impact resistant grout containing non-metallic fibers, similar to Set "Impact Resistant Grout". The grout shall be mixed and applied in accordance with the manufacturer's recommendations.



COLUMN ELEVATION (TYP.)

CAP CONSTRUCTION JOINT DETAIL
Scale 3/4" = 1'-0"

NOTES:

1. All concrete shall be Class "C", design fc = 1200 p.s.i. Chamfer all exposed corners ¾" unless otherwise noted
2. All reinforcing steel shall be ASTM A615, Grade 60, fy = 60,000 p.s.i.
3. Dimensions relating to reinforcing steel are to outside dimension of bar, with radii shown to be inside of bar.
4. See General Plan and Elevation drawing for expansion or fixed end conditions of spans.
5. Average calculated drilled shaft load = 93 tons/shaft
6. Elevations shown, other than the bearing seat elevations, are given at front face of abutment backwall.
7. See South Abutment Details, Sheet 2 of 2, for Foundation Note.

PLAN
Scale: 3/8" = 1'-0"

FOUNDATION NOTE:
The Contractor may construct retaining walls and place roadway embankment prior to construction of abutment columns and drilled shaft foundations. If the Contractor elects this option, the drilled shafts will be extended to the bottom of the abutment cap, and the column section shown on the plans will be deleted. The construction procedure for installation of the drilled shafts after embankment and retaining walls are in place shall be submitted to the Engineer for approval, prior to beginning construction operations. Payment for the additional drilled shafts lengths to replace columns will remain as the price bid for the column concrete and reinforcing steel shown in the Plan Quantities.

NOTES

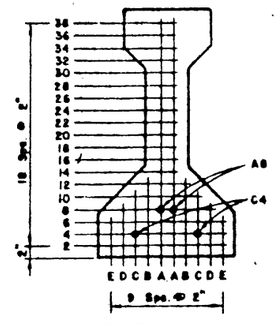
* LENGTH AT ℄ OF TOLLWAY



TYPE C BM.

GENERAL NOTES:

Designed in accordance with current A.A.S.H.T.O. Specifications.

All concrete shall be Class H.

When shown on this sheet, the fabricator has the option of furnishing either the designed depressed strand beam or an approved optional beam design. Low relaxation strands may be used.

Prestressed losses for the designed beams have been calculated according to the A.A.S.H.T.O. 1982 Interim Specifications for a relative humidity of 65%. Optional designs shall likewise conform.

Certain beams with depressed strands are subject to cracking in the end of the beam. When such cracks occur, all subsequent beams of the same type and strand pattern shall have strands wrapped in the following manner:
1. Alternate rows of depressed strands shall be wrapped for 2 feet from each end of the beam.
2. One half of the straight strands, as nearly as possible, shall be wrapped for 4 feet from each end of the beam.
3. The wrapping pattern shall be symmetrical about the vertical axis of the beam for both depressed and straight strands.
4. Strands shall be wrapped so that the centers of gravity of the depressed strands and the straight strands will remain within 1 inch of their original location.
5. Strands shall be tightly wrapped with a waterproof adhesive tape or plastic tubing may be used provided both ends and the seam of the tube are sealed with a waterproof tape.
6. Revised shop drawings will not be required, but wrapping patterns, and the beams effected, shall appear on the as-built drawings.

For depressed strand designed beams, strands shall be located as low as possible on the 2" grid system shown hereon, unless a non-standard strand pattern is indicated. Fill Row "2", then Row "4", then Row "6", etc., beginning each row in the "A" position and working outward until the required number of strands is reached. All strands in the "A" position shall be depressed, maintaining the 2" spacing so that the upper two strands are in the position shown in the table at the beam ends.

Initial pretension for 1/2" 270 K strands = 28.9 K for regular stress relieved strand or 31.0 K for low relaxation strands.

Horizontal distances are shown for SPAN LENGTH and BEAM LENGTH. They must be corrected for grade or cross slope where appropriate.

PLAN

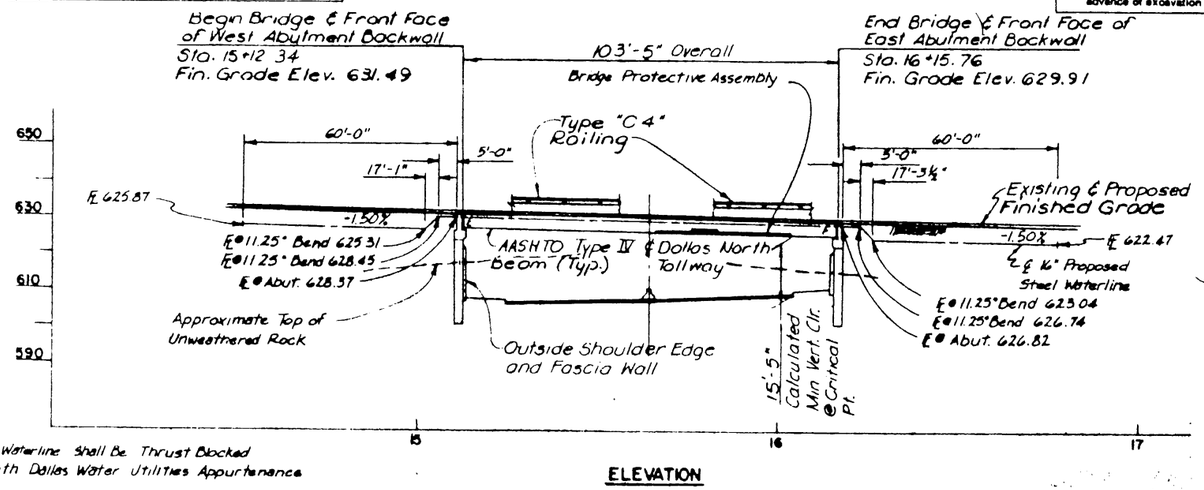
NOTE

Subsurface information shown on this drawing was obtained solely for use in establishing design controls for the project. The accuracy of this information is not guaranteed and it is not to be construed as part of the plans and specifications governing construction of the project. It is the Bidder's responsibility to inquire of the particular section engineer on any section to be bid as to whether additional information is available and to make arrangements to review same prior to bidding. Each Bidder is responsible for making his own determinations as to all subsurface conditions and limits.

NOTE:

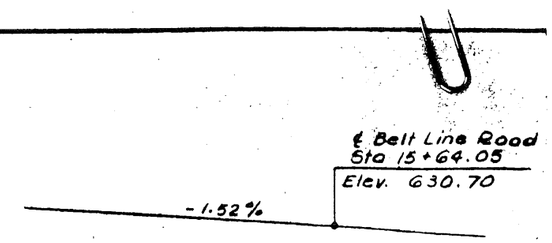
The information shown on this drawing concerning type and location of underground utilities is not guaranteed to be accurate or all inclusive. The Contractor is responsible for making his own determinations as to type and location of underground utilities as may be necessary to avoid damage thereto. The Contractor shall verify location of underground pipe lines, conduits, and structures by contacting owners of underground utilities and by prospecting in advance of excavation operations.



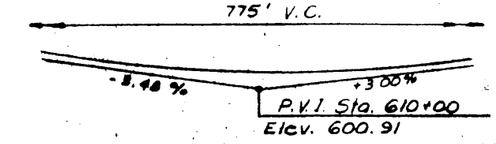
ELEVATION

NOTE:

1. All Bends On 16" Waterline Shall Be Thrust Blocked In Accordance With Dallas Water Utilities Appurtenance Sheet 414-D-15.
2. All Joints of 16" Waterline Shall Be Welded.



PROFILE GRADE LINE - BELT LINE ROAD



PROFILE GRADE LINE - TOLLWAY

GENERAL NOTES:

Designed according to AASHTO 1977 Standard and Interim Specifications thru 1982 for an HS20-44 loading.

Bridge Protective Assembly shall be attached to the outside face of exterior beams to points 6 inches beyond the limits of the roadway at the locations shown. For details, see Standard Drawing No. 29.

For Traffic Barrier and Combination Rail Details, See Standard Drawings No. 31, 32, & 33.

All dimensions are horizontal or vertical and must be corrected for Grade, Crown, and/or Superelevation.

BENCHMARK DATA

Chiseled Square in Concrete Curb at Nose Point of Triangular Island that Frames a Steak and Ale Sign at N.W. Corner of Steak and Ale Parking Lot at Intersection of Belt Line Road and Sakowitz Drive, Approximately 500 Feet East of Dallas Parkway Along Belt Line Road, El 625.59.

BEARING SEAT DETAIL
Scale 3/4" = 1'-0"

Note: Built-up portions of bearing seat shall be cast integrally with cap or constructed as follows: The area under the built-up portion is to be prepared in accordance with specification requirements for construction joints. The pedestal shall then be placed using an approved pre-packaged, non-shrink, impact resistant grout containing non-metallic fibers, similar to Sat "Impact Resistant Grout." The grout shall be mixed and applied in accordance with the manufacturer's recommendations.

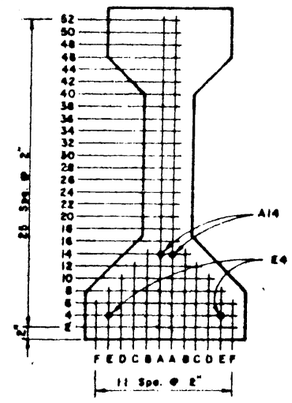
* LENGTH AT ℄ OF BELT LINE RD.



AASHTO TYPE IV BM.

GENERAL NOTES:

Designed in accordance with current A.A.S.H.T.O. Specifications.

All concrete shall be Class H

When shown on this sheet, the fabricator has the option of furnishing either the designed depressed strand beam or an approved optional beam design. Low relaxation strands may be used

Prestressed losses for the designed beams have been calculated according to the A.A.S.H.T.O. 1982 Interim Specifications for a relative humidity of 65%. Optional designs shall likewise conform

Certain beams with depressed strands are subject to cracking in the end of the beam. When such cracks occur, all subsequent beams of the same type and strand pattern shall have strands wrapped in the following manner:
1. Alternate rows of depressed strands shall be wrapped for 2 feet from each end of the beam.
2. One half of the straight strands, as nearly as possible, shall be wrapped for 4 feet from each end of the beam.
3. The wrapping pattern shall be symmetrical about the vertical axis of the beam for both depressed and straight strands.
4. Strands shall be wrapped so that the centers of gravity of the depressed strands and the straight strands will remain within 1 inch of their original location.
5. Strands shall be tightly wrapped with a waterproof adhesive tape or plastic tubing may be used provided both ends and the seam of the tube are sealed with a waterproof tape.
6. Revised shop drawings will not be required, but wrapping patterns, and the beams affected, shall appear on the as-built drawings.

For depressed strand designed beams, strands shall be located as low as possible on the 2" grid system shown hereon, unless a non-standard strand pattern is indicated. Fill Row "2", then Row "4", then Row "6", etc., beginning each row in the "A" position and working outward until the required number of strands is reached. All strands in the "A" position shall be depressed, maintaining the 2" spacing so that the upper two strands are in the position shown in the table at the beam ends.

Initial pretension for 1/2" 270 K strands = 28.9 K for regular stress relieved strand or 31.0 K for low relaxation strands.

Horizontal distances are shown for SPAN LENGTH and BEAM LENGTH. They must be corrected for grade or cross slope, where appropriate.

BENT BAR DIAGRAMS

GENERAL NOTES

The approach slab shall be finished as required for the structure or as directed by the Engineer.

Reinforcing steel shall conform to ASTM designation A-615, Grade 60. Splices shall be a minimum of 20 times the nominal diameter of the bar.

The chairs used to support the bar mat shall be of sufficient structural quality and number to hold the mat within the placement height tolerances, and shall be of a type approved by the Engineer.

Payment for the variable thickness approach slab, and support slab, shall be made at the unit price bid for "Concrete Pavement (Water Cement Ratio)(Approach Slab) (9")." Joint seals, reinforcing steel, and any excavation and backfill required for the approach slab and support slab shall be considered subsidiary to the bid item.

For roadway pavement details, see Standard Drawings No. 12 and 15.

NOTE:
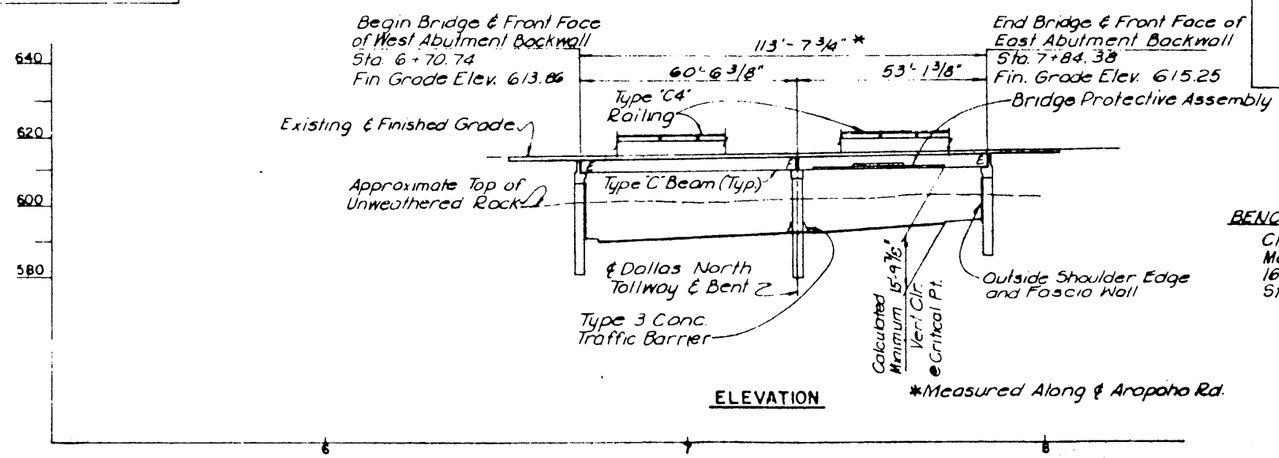
Subsurface information shown on this drawing was obtained solely for use in establishing design controls for the project. The accuracy of this information is not guaranteed and it is not to be construed as part of the plans and specifications governing construction of the project. It is the Bidder's responsibility to inquire of the particular section engineer on any section to be bid as to whether additional information is available and to make arrangements to review same prior to bidding. Each Bidder is responsible for making his own determinations as to all subsurface conditions and limits.

NOTE:
The information shown on this drawing concerning type and location of underground utilities is not guaranteed to be accurate or all inclusive. The Contractor is responsible for making his own determinations as to type and location of underground utilities as may be necessary to avoid damage thereto. The Contractor shall verify location of underground pipe lines, conduits, and structures by contacting owners of underground utilities and by prospecting in advance of excavation operations.



ELEVATION

*Measured Along ℄ Arapaho Rd.

GENERAL NOTES

Designed According To AASHTO 1977 Standard And Interim Specifications Thru 1982 For HS20-44 Loading.

Bridge Protective Assemblies Shall Be Attached To The Outside Face Of Exterior Beams To Points 6 Inches Beyond The Limits Of The Roadway At The Locations Shown. For Details, See Standard Drawing No. 29.

For Approach Slab Details, See Sheet No.

For Traffic Barrier And Combination Rail Details, See Standard Drawing No. 31, 32 And 33.

All Dimensions Are Horizontal Or Vertical And Must Be Corrected For Grade, Crown, And/Or Superelevation.

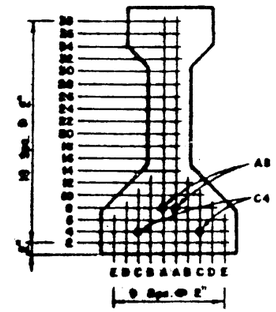
* LENGTH AT ℄ OF ARAPAHO ROAD



TYPE C BM.

GENERAL NOTES:

Designed in accordance with current A.A.S.H.T.O. Specifications.

All concrete shall be Class H.

When shown on this sheet, the fabricator has the option of furnishing either the designed depressed strand beam or an approved optional beam design. Low relaxation strands may be used.

Prestressed losses for the designed beams have been calculated according to the A.A.S.H.T.O. 1982 Interim Specifications for a relative humidity of 65%. Optional designs shall likewise conform.

Certain beams with depressed strands are subject to cracking in the end of the beam. When such cracks occur, all subsequent beams of the same type and strand pattern shall have strands wrapped in the following manner:
1. Alternate rows of depressed strands shall be wrapped for 2 feet from each end of the beam.
2. One half of the straight strands, as nearly as possible, shall be wrapped for 4 feet from each end of the beam.
3. The wrapping pattern shall be symmetrical about the vertical axis of the beam for both depressed and straight strands.
4. Strands shall be wrapped so that the centers of gravity of the depressed strands and the straight strands will remain within 1 inch of their original location.
5. Strands shall be tightly wrapped with a waterproof adhesive tape or plastic tubing may be used provided both ends and the seam of the tube are sealed with a waterproof tape.
6. Revised shop drawings will not be required, but wrapping patterns, and the beams affected, shall appear on the as-built drawings.

For depressed strand designed beams, strands shall be located as low as possible on the 2" grid system shown hereon, unless a non-standard strand pattern is indicated. Fill Row "2", then Row "4", then Row "6", etc., beginning each row in the "A" position and working outward until the required number of strands is reached. All strands in the "A" position shall be depressed, maintaining the 2" spacing so that the upper two strands are in the position shown in the table at the beam ends.

Initial pretension for 1/2" 270 K strands = 28.9 K for regular stress relieved strand or 31.0 K for low relaxation strands.

Horizontal distances are shown for SPAN LENGTH and BEAM LENGTH. They must be corrected for grade or cross slope, where appropriate.

BENT BAR DIAGRAMS

GENERAL NOTES:

The approach slab shall be finished as required for the structure or as directed by the Engineer

Reinforcing steel shall conform to ASTM designation A-615, Grade 60 Splices shall be a minimum of 20 times the nominal diameter of the bar.

The chair used to support the bar mat shall be of sufficient structural quality and number to hold the mat within the placement height tolerances, and shall be of a type approved by the Engineer

Payment for the variable thickness approach slab and support slab, shall be made at the unit price bid for "Concrete Pavement (Water Cement Ratio)(Approach Slab)(9)". Joint seals, reinforcing steel, and any excavation and backfill required for the approach slab and support slab shall be considered subsidiary to the bid item.

For roadway pavement details, see Standard Drawings No. 12 and 15

NOTE:
Subsurface information shown on this drawing was obtained solely for use in establishing design controls for the project. The accuracy of this information is not guaranteed and it is not to be construed as part of the plans and specifications governing construction of the project. It is the Bidder's responsibility to inquire of the particular section engineer on any section to be bid as to whether additional information is available and to make arrangements to review same prior to bidding. Each Bidder is responsible for making his own determinations as to all subsurface conditions and limits.

NOTE:
The information shown on this drawing concerning type and location of underground utilities is not guaranteed to be accurate or all inclusive. The Contractor is responsible for making his own determinations as to type and location of underground utilities as may be necessary to avoid damage thereto. The Contractor shall verify location of underground pipe lines, conduits, and structures by contacting owners of underground utilities and by prospecting in advance of excavation operations.

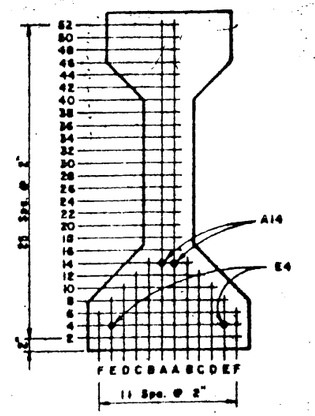
* LENGTH AT ℄ OF S.S.W. RAILWAY.



AASHTO TYPE IV BM.

GENERAL NOTES:

Designed in accordance with current A.R.E.A Specifications.

All concrete shall be Class H.

When shown on this sheet, the fabricator has the option of furnishing either the designed depressed strand beam or an approved optional beam design. Low relaxation strands may be used.

Prestressed losses for the designed beams have been calculated according to the A.R.E.A Specifications for a relative humidity of 65%. Optional designs shall likewise conform.

Certain beams with depressed strands are subject to cracking in the end of the beam. When such cracks occur, all subsequent beams of the same type and strand pattern shall have strands wrapped in the following manner:
1. Alternate rows of depressed strands shall be wrapped for 2 feet from each end of the beam.
2. One half of the straight strands, as nearly as possible, shall be wrapped for 4 feet from each end of the beam.
3. The wrapping pattern shall be symmetrical about the vertical axis of the beam for both depressed and straight strands.
4. Strands shall be wrapped so that the centers of gravity of the depressed strands and the straight strands will remain within 1 inch of their original location.
5. Strands shall be tightly wrapped with a waterproof adhesive tape or plastic tubing may be used provided both ends and the seam of the tube are sealed with a waterproof tape.
6. Revised shop drawings will not be required, but wrapping patterns, and the beams affected, shall appear on the as-built drawings.

For depressed strand designed beams, strands shall be located as low as possible on the 2" grid system shown hereon, unless a non-standard strand pattern is indicated. Fill Row "2", then Row "4", then Row "6", etc., beginning each row in the "A" position and working outward until the required number of strands is reached. All strands in the "A" position shall be depressed, maintaining the 2" spacing so that the upper two strands are in the position shown in the table of the beam ends.

Initial pretension for 1/2" 270 K strands = 28.9 K for regular stress relieved strand or 31.0 K for low relaxation strands.

Horizontal distances are shown for SPAN LENGTH and BEAM LENGTH. They must be corrected for grade or cross slope, where appropriate.

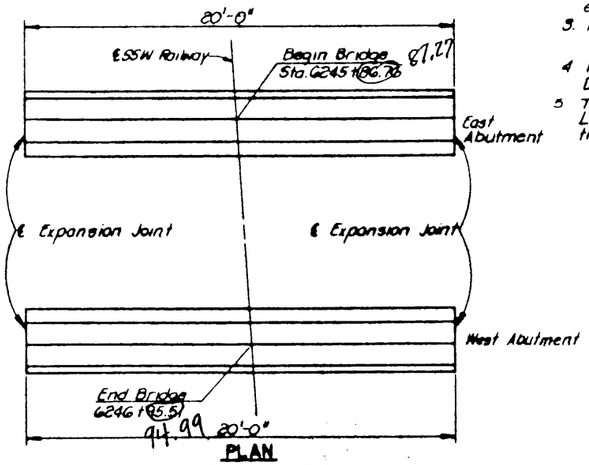
Scale: ¼"=1'-0"



PLAN
FASCIA WALL PANELS
N.T.S.

General Notes:
1. All concrete for drilled shafts and concrete fascia walls shall be Class "C".
2. All reinforcing steel shall be ASTM A-615, Grade 60 except spiral bars.
3. For details and dimensions of Surface Texture, see Standard Dwg. No. 41
4. For Fascia Wall End Detail, See Detail 1, Abutment Details Sheet No.
5. The Contractor shall develop a Rustication Layout for each Abutment for approval by the Engineer.

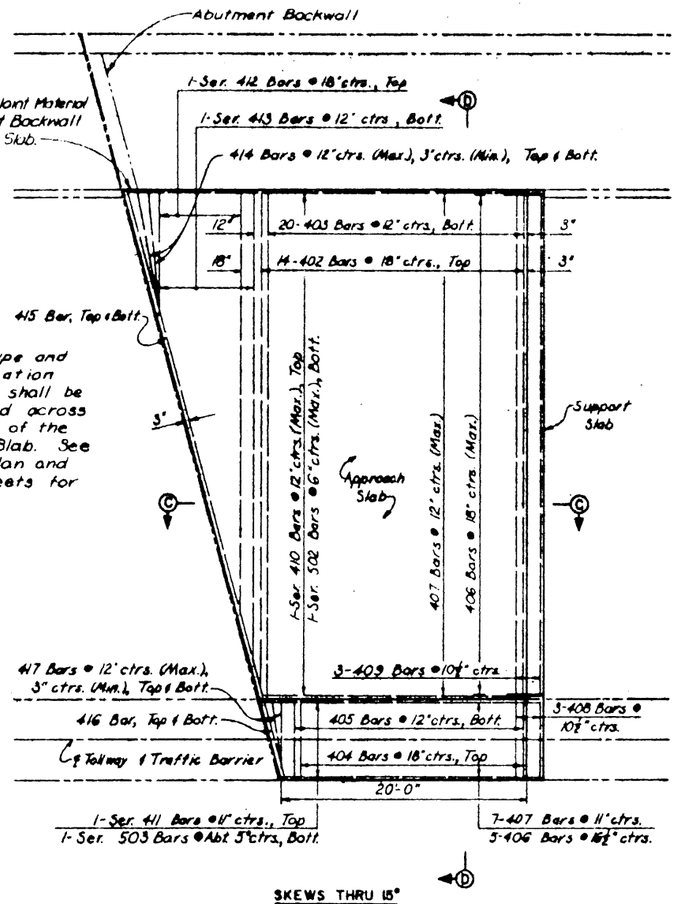
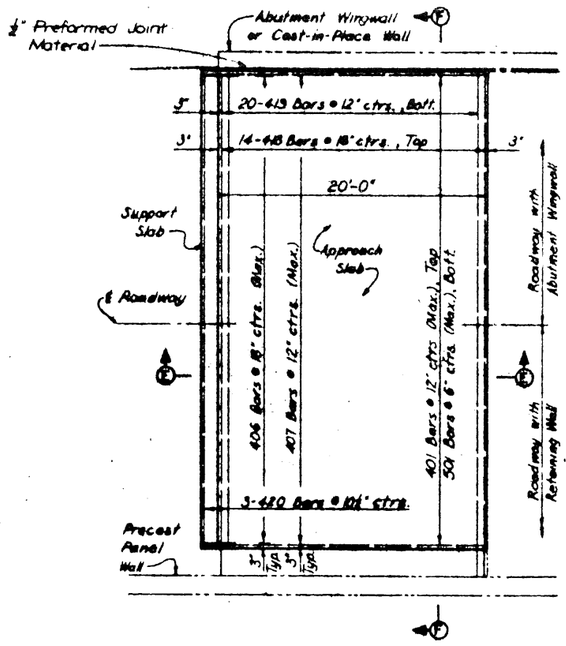
NORMAL CONDITION



Note Curb type and curb elimination transitions shall be accomplished across the length of the Approach Slab. See Roadway Plan and Profile sheets for locations.

SKEWS THRU 15°

MAINLINE APPROACH SLAB



INTERCHANGE APPROACH SLAB

GENERAL NOTES:

The approach slab shall have the same transverse crown throughout its length as the structure which it adjoins.

The approach slab shall be finished as required for the structure or as directed by the Engineer.

Reinforcing steel shall conform to ASTM Designation A-615, Grade 60. Splices shall be a minimum of 20 times the nominal diameter of the bar.

The chairs used to support the bar mat shall be of sufficient structural quality and number to hold the mat within the placement height tolerances, and shall be of a type approved by the Engineer.

For details of Type A and Type M curbs, see Standard Drawing No. 11.

Payment for the approach slab, support slab, and curb shall be made at the unit price bid for "Concrete Pavement (Water Cement Ratio) (Approach Slab) (9")." Joint seals, reinforcing steel, and any excavation required for the approach slab and support slab shall be considered subsidiary to the bid item.

For roadway pavement details, see Standard Drawings No. 12 and 15.

Skew Angle of Bent End

REPRODUCED FROM

TEXAS STATE DEPARTMENT OF HIGHWAYS AND PUBLIC TRANSPORTATION

STANDARD DRAWING Gp B 4-71

GENERAL NOTES

Beams shall be seated on elastomeric bearings of the dimensions shown.

Bearings shall be furnished with their thickness varying in one direction depending on the slope of the erected bear to 5% grades.

Constant thickness bearings may be used for moderate beam slopes if the variation is within the allowable dimensional tolerances given in the specifications.

Cost of furnishing and installing elastomeric bearing shall be included in unit price bid for "Prestressed Concrete Beams"

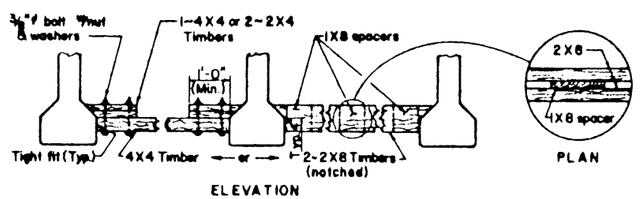
①



ELEVATION

PLAN

BOTTOM FLANGE BRACING DETAILS

②

GENERAL NOTES:

ERECTION BRACING

Erection bracing details are considered minimum for fulfilling the requirements of Specification Item 425 (Article 425.5), and Special Provisions thereto, for bracing Types A, B, C, III, IV and V prestressed concrete beams erected in the span over a traveled way or railroad, and in those spans generally parallel to a traveled way or railroad and within a distance equal to the difference in elevation between the top of cap upon which the beams are being erected and the traveled way, or 30 feet, whichever is greater.

△ Required erection bracing shall be placed immediately after erection of each beam and remain in place until channel diaphragms are tightened and additional bracing as required for slab placement is in place.

SLAB PLACEMENT BRACING

The details for slab placement bracing are considered minimum for fulfilling the requirements of Specification Item 420, Article 420.9(4) and special provisions thereto.

Required slab placement bracing shall remain in place until the slab concrete has attained a flexural strength of 500 p.s.i.

GENERAL

Bracing details for closely spaced beams (as on ramps or railroad structures) are not included herein. The Contractor shall submit his proposed bracing details for such conditions to the Engineer for approval prior to erection.

Systems equal to or better than those shown may be used provided details of such systems are submitted to and approved by the Engineer prior to erection.

Use of these systems and/or details does not relieve the Contractor of the responsibility for the adequacy of the bracing and the safety of the structure.

Removal of bracing for short periods of time to align beams is permissible.

Bottom flange bracing at beam ends may be omitted when all beams are fixed with dowel bars or when erection is on steel caps or floor beams containing bearing seats which restrict lateral movement.

All turn-buckles, come-alongs and other connections shall be capable of developing the full strength of the cable shown hereon.

CONTRACT NO. DNT-114

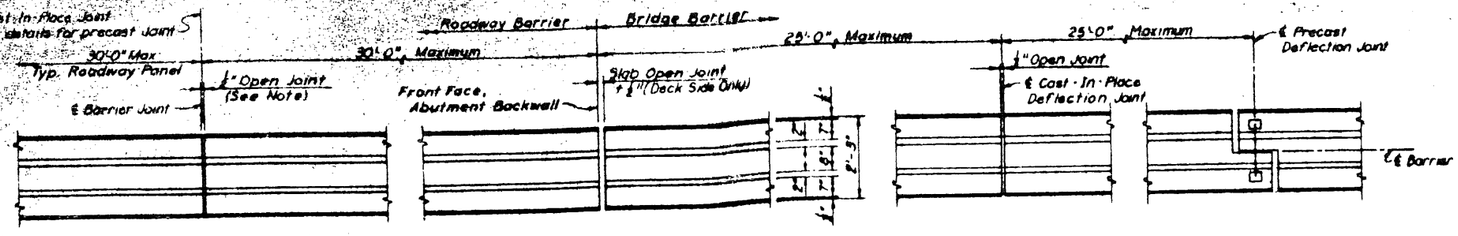
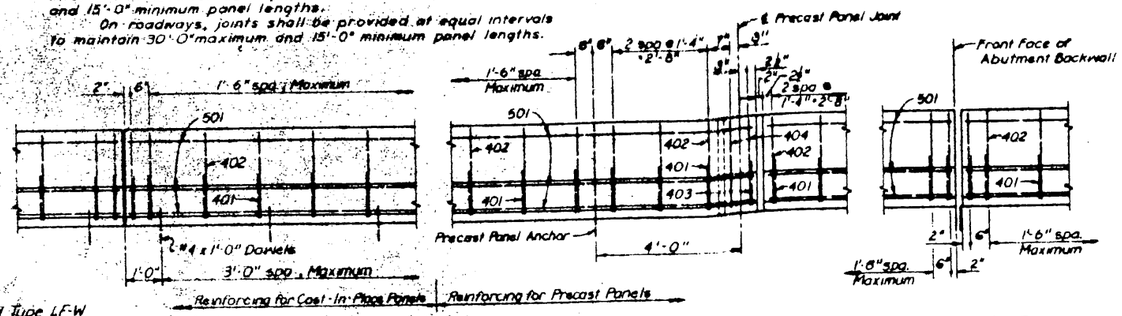
004161

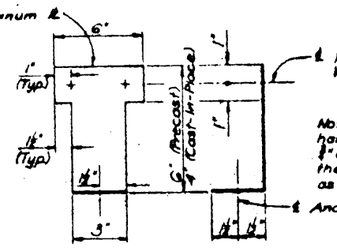


Note: On bridges, joints shall be provided at ends of spans, over interior supports of continuous units, and at equal intervals in between as required to maintain 25'-0" maximum and 15'-0" minimum panel lengths.
On roadways, joints shall be provided at equal intervals to maintain 30'-0" maximum and 15'-0" minimum panel lengths.



ELEVATION

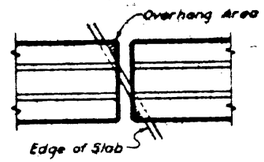
ABUTMENT JOINT



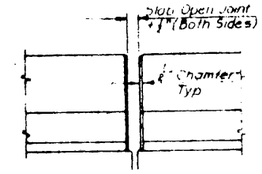
STATION MARKER BRACKET

Note: Place bracket @ 500'± centers. Fasten to barrier at anchorage locations (Precast Roadway Units) or special insert locations (Precast Bridge Units and Cast-In-Place Units).

Note: At points where the barrier overhangs an adjacent bridge span slab, a ⅜" clearance shall be provided between the barrier and the slab using material as described for panel joint forming.



PLAN



ELEVATION

EXPANSION JOINT DETAILS

REINFORCING STEEL NOTES

Bar dimension are given out-to-out of bar.
Radii are given to inside of bar.
Reinforcing bar callouts consist of the bar size, followed by an individual two digit number

PRECAST PANEL LIFTING DETAIL

2 "ø Richmond Type LF-W Insert for Tollway station marker where required by the Engineer.

GENERAL NOTES:

Designed according to AASHTO 1977 Standard Specifications and Interim Specifications thru 1982.
All concrete, reinforcement, anchor bolts, blocking, inserts, grout, etc., as shown, are considered a part of the barrier for payment.
The centerline axis of the barrier shall be vertical unless otherwise shown on the plans or directed by the Engineer.
Unless otherwise shown on the plans, the Contractor may furnish either a precast or a cast-in-place traffic barrier.
The maximum offset from the center of the barrier to the true circular centerline shall be one inch for precast segments installed on horizontal curves. If this would require segment lengths of less than 15 feet, then the barrier shall be cast in place to the correct radius.
Shop drawings are not required for this barrier.
All steel fittings for barrier joints shall be galvanized after fabrication.
For modifications to the standard barrier cross section at median drainage inlets, see Standard Drawing No. 2.

MATERIAL NOTES:

All concrete shall be Class C.
Barrier forms shall be constructed of steel.
Grout for precast barriers shall consist of two parts sand and one part cement. Latex adhesive may be added to the grout if directed by the Engineer. Wood, or other material approved by the Engineer, shall be used for blocking. At other locations, any suitable material may be used to retain the grout.
Anchor bolts, threaded rods, and associated nuts, washers, and plates for the precast panel to slab and panel to panel attachment shall be galvanized.
Bolts shall conform to ASTM A-307 (or A-36 threaded rod with tack welded nut). Threaded rods may be 0.906 inch minimum diameter with rolled threads. Nuts shall conform to A-307 requirements and shall be tapped or chased after galvanizing. Bolts and nuts shall have Class 2A and 2B fit tolerances.
All precast panel joint plates and plate washers shall conform to the requirements of ASTM A-36.

REINFORCING STEEL NOTES

Bar dimensions are given out to out of bar.
Radii are given to inside of bar.
Reinforcing bar callouts consist of the bar size followed by an individual two digit number.

TYPE 2 CONCRETE TRAFFIC BARRIER NOTES:

Anchor bolts and conduit will not be paid directly but shall be considered subsidiary to the item "Concrete Traffic Barrier (Type 2)".
All high strength anchor bolts shall be ¼"ø x 2'-3" ASTM A 325 bolts with the top threaded not less than 6", and this threaded end galvanized not less than 8" and furnished with galvanized hex nuts, flat and lock washers. The lower end of the rods shall be threaded 2" and furnished with ⅜"x4"x8" anchor plates and nuts. Tack weld anchor plates to nuts.
For Section A-A, see Cast In Place Section on Standard Drawing No. 31.
For additional notes, see Standard Drawing No. 31.

TYPE 3 CONCRETE TRAFFIC BARRIER NOTES:

Longitudinal bars at construction joints shall extend beyond the joint so that 24 bar diameter splices will be a minimum of two feet from the construction joint.
For details of standard sections and the cast-in place & precast joints, see Standard Drawing No. 31.
For additional notes, see Standard Drawing No. 31.

SPLICE DETAIL

RAIL MEMBER DETAILS

GENERAL NOTES:

△ Designed according to AASHTO 1977 Standard and Interim Specifications thru 1982.

All span ends of the rail shall be capped.

The face of concrete railing shall be vertical unless otherwise shown in plans. Rail posts shall be perpendicular to top of concrete. Grout may be used under base plates if necessary.

Panel lengths of rail shall be attached to a minimum of three posts except at abutment wingwall.

All steel components except reinforcing shall be galvanized unless otherwise shown in plans. Nuts and washers for anchor bolts shall conform to A 325 requirements. Nuts shall be tapped or chased after galvanizing. Bolts and nuts shall have Class 2A and 2B fit tolerances.

△ For precast anchorage details, see Standard Drawing No. 27.

Posts shall be cast aluminum alloy A444 T4

Material for rails shall be aluminum - A S T M B221 - alloy 6061-T6

Machine screws for rail attachment shall be stainless steel

For horizontal curves of radius less than 1080 ft the rail member shall be fabricated to follow the curvature of the roadway

Castings shall have a maximum draft of 3° and a minimum radius of fillet of 1/4" unless otherwise shown

Unit bid price for Rail Type C4 includes: Metal Railing, Posts, Connectors, Anchor Bolts; Concrete Parapet Wall is included in the Class "C" Concrete (Slab) Quantity and will be paid for under Item 422, Reinforced Concrete Slab
