Schedule Impact: 2 days

Request: **Date Required: 6/28/2012**
It appears that the W18x46 beam (running north and south) connects to the W14x22 beam (running east and west). There are a couple of concerns/questions.
1. The flanges on the big beam will have to be cut to "wrap" around the column, as it is about 6" wide. Please provide a detail.
2. Please provide a detail to show the connection for the large beam to tie to the smaller beam.

Requested by: David Miller
Embrey Builders LLC

Response:

Refer to detail 3/S4.01. The flanges of the W18x46 may be coped as required.

There are several places on these drawings that appear to show steel beams centered on exterior walls. The largest beam is 10.25" wide looks like it is centered on a 3.5" wall. Please confirm that the dimensions on the drawings have been coordinated with Architectural drawings and with steel sizes and that none of the beams are going to affect the exterior skin.

Requested by: David Miller
Embrey Builders LLC

Response:
SK-13 deals with this issue on the north side of the club.

PPO's response to RFI 176 cleared up this issue on the A2-SP unit above the garage entry.

Many talks with Brian and Les (Embrey) and Ryan and Walter (BGO) have worked on this issue, althouth minor, south of the club in the courtyard using extra studs to bump out the stucco finish and gyp board around the steel beams.

Based on our discusson on 5/30/12 conference call, please provide a method to support the exterior wall above the patio at the Fitness Center. The measurement that the framer came up with was 5 1/2 inches that would need to be padded out.

Drawing: 3/S3.02
Cost Impact: None

Spec Section:
Schedule Impact: None

Request: **Date Required: 2/6/2012**

3/S3.02 shows typical drop panel detail (pier cap). We are confused and not sure of the proper steel size and placement. Are L bars being used and is it tied to the pier steel or doweled? Also, what is the size of the steel for L bars. Where plan shows #4 at 12" O.C. each way bottom, why is spacing on detail more than 12"? We need to have more clear information on the pier cap steel so we do it correct the 1st time, see attachments with comments.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

Please see attached for bar placement and submit reinforcing steel shop drawings for approval.

Provide #4 at 12" on center in large areas. Provide #4 bars as indicated in detail 3/S3.02 at 6'-0"x6'-0" drop caps.

CORRUGATED PAPER FORMS, AS MANUFACTURERED BY SUREVOID PRODUCTS INC., SHALL BE INSTALLED IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE MANUFACTURER TO PROVIDE A NOMINAL SIX (6) INCH VOID BENEATH ALL GRADE BEAMS. 3/8 INCH THICK BY TWELVE (12) INCH HIGH PLASTIC BACKFILL RETAINER BOARDS, AS MANUFACTURED BY SUREVOID PRODUCTS, INC., SHALL BE INSTALLED IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE MANUFACTURER CONTINUOUSLY ALONG EACH SIDE OF ALL GRADE BEAMS.

6. THE GARAGE SLAB ON GRADE SHALL BE PLACED OVER A FOUR (4) INCH THICK LAYER OF MOIST COARSE SAND OVER UNDISTURBED NATURAL SOIL OR COMPACTED AND TESTED SELECT FILL REQUIRED TO ACHIEVE FINAL GRADES. THE BUILDING AREA SHALL BE STRIPPED OF ALL VEGETATION, TOPSOIL AND ANY OTHER DELETERIOUS MATERIALS. THE EXPOSED SUBGRADE SOILS SHALL BE PROOF-ROLLED WITH A HEAVY VEHICLE TO EVIDENCE WEAK AREAS. SOFT SPOTS IN THE SUBGRADE SHALL BE EXCAVATED TO FIRM SOIL AND REPLACED WITH SELECT FILL IN ACCORDANCE WITH THE PROJECT GEOTECHNICAL REPORT.

7. INFORMATION ABOVE IS PRESENTED ONLY AS A SUMMARY OF THE PROJECT GEOTECHNICAL REPORT. THE CONTRACTOR IS RESPONSIBLE FOR REVIEWING AND COMPLYING WITH THE RECOMMENDATIONS CONTAINED IN THE PROJECT GEOTECHNICAL REPORT. THE STRUCTURAL ENGINEER IS NOT RESPONSIBLE FOR SUBSURFACE CONDITIONS ENCOUNTERED IN THE FIELD DIFFERENT TO THOSE ASSUMED FOR DESIGN.

8. BECAUSE OF THE ELAPSED TIME, THE CURRENT SOIL CONDITIONS MAY DIFFER SIGNIFICANTLY FROM THE SAMPLES THAT WERE USED IN THE DEVELOPMENT OF THE PROJECT GEOTECHNICAL REPORT REFERENCED ABOVE. THEREFORE, IT IS RECOMMENDED THAT THE BUILDING OWNER CONSULT WITH THE PROJECT GEOTECHNICAL ENGINEER TO DETERMINE IF THE FOUNDATION DESIGN PARAMETERS ARE CONSISTENT WITH THE CURRENT SOIL CONDITIONS.

Under Wood Sheathing Notes, Note 4 calls for two layers of 1/4" sheathing attached to metal studs. Can use regular wood framing in lieu of the metal studs?

Requested by: David Miller
Embrey Builders LLC

Response:

Yes. Wood studs may be used as noted in stud schedule 2/S1.03. Attachment shall be made with # 8 wood screws spaced at 6" on center at all panel edges and 12" on center at intermediate supports. Apply a coat of construction adhesive between layers and stagger panel edges.

3. THE STRUCTURAL DRAWINGS AND SPECIFICATIONS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHODS OF CONSTRUCTION UNLESS SO STATED OR NOTED. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE WORKMEN AND OTHER PERSONS DURING CONSTRUCTION.
4. THE STRUCTURAL DRAWINGS SHALL NOT BE SCALED FOR DETERMINATION OF QUANTITY, LENGTH OR FIT OF MATERIALS.
5. PRINCIPAL OPENINGS ARE INDICATED ON THE STRUCTURAL DRAWINGS. REFER TO ARCHITECTURAL, MECHANICAL AND ELECTRICAL DRAWINGS FOR SLEEVES, BLOCKOUTS, INSERTS, CURBS, OPENINGS AND SLAB DEPRESSIONS NOT SHOWN.
6. CONTRACTOR SHALL COMPARE STRUCTURAL AND ARCHITECTURAL DRAWINGS AND REPORT ANY DISCREPANCY TO THE ARCHITECT PRIOR TO FABRICATION OR INSTALLATION OF STRUCTURAL MEMBERS.
7. CONTRACTOR SHALL INSURE THAT CONSTRUCTION MATERIALS WHOSE WEIGHT EXCEEDS THE DESIGN LIVE LOADS INDICATED ON THE STRUCTURAL DRAWINGS ARE NOT STORED ON STRUCTURALLY SUPPORTED FLOOR OR ROOF FRAMING.
8. THE CONTRACTOR SHALL PROVIDE TEMPORARY ERECTION BRACING AND SHORING OF ALL STRUCTURAL WORK AS REQUIRED FOR STABILITY OF THE STRUCTURE DURING ALL PHASES OF CONSTRUCTION. THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE ENGINEER OF ANY CONDITION WHICH, IN HIS OR HER OPINION, MIGHT ENDANGER THE STABILITY OF THE STRUCTURE OR CAUSE DISTRESS IN THE STRUCTURE.
9. LOADINGS FOR MECHANICAL EQUIPMENT ARE BASED ON THE UNIT(S) SHOWN ON THE STRUCTURAL DRAWINGS. ANY CHANGES IN TYPE, SIZE, WEIGHT OR NUMBER OF UNIT(S) SHALL BE REPORTED TO THE ARCHITECT PRIOR TO FABRICATION OR INSTALLATION OF STRUCTURAL MEMBERS OR MECHANICAL EQUIPMENT.
10. REPRODUCTION OF THE STRUCTURAL DRAWINGS, EITHER IN PART OR IN WHOLE, FOR SUBMITTALS OR SHOP DRAWINGS IS NOT PERMITTED. SUCH SUBMITTALS AND SHOP DRAWINGS MAY BE REJECTED.
11. CONTRACTOR SHALL SCHEDULE SITE OBSERVATION VISITS WITH THE ENGINEER OF RECORD AND/OR TESTING LABORATORY A MINIMUM OF FORTY-EIGHT HOURS PRIOR TO THE REQUIRED TIME OF THE VISIT.
12. CONTRACTOR SHALL ALLOW TEN (10) WORKING DAYS FOR THE ENGINEER TO REVIEW EACH STRUCTURAL SUBMITTAL OR SHOP DRAWING.

FOUNDATION NOTES

1. THE BUILDING FOUNDATION DESIGN IS BASED ON THE PROJECT GEOTECHNICAL REPORT PREPARED BY REED ENGINEERING GROUP, INC. (PROJECT NO. 13998) DATED DECEMBER 15, 2006 AND A SUPPLEMENTAL LETTER DATED MAY 2, 2007. REFER TO SHEET SG1.01 FOR PARKING GARAGE FOUNDATION INFORMATION.
2. THE BUILDING FOUNDATION DESIGN IS BASED ON A POTENTIAL VERTICAL MOVEMENT, PVM, ON THE ORDER OF ONE (1) INCH OR LESS. IF THIS VALUE IS NOT ACCEPTABLE TO THE OWNER OR TENANTS, THE FOUNDATION DESIGN MUST BE REVISED.
3. THE BUILDING FOUNDATION SHALL CONSIST OF A SHALLOW, MONOLITHIC, EARTH-FORMED, POST-TENSIONED REINFORCED CONCRETE STIFFENED SLAB AND BEAM SYSTEM. GRADE BEAMS HAVE BEEN PROPORTIONED FOR AN ALLOWABLE BEARING PRESSURE OF 3,000 PSF.
4. ALL UNEXPOSED SURFACES OF FOOTINGS/GRADE BEAMS AT THE BUILDING SHALL BE EARTH-FORMED. PROVIDE FORMWORK FOR ALL EXPOSED SURFACES AND THE UPPER TWELVE (12) INCHES OF ALL EXTERIOR FOOTINGS/GRADE BEAMS.
5. THE SLAB ON GRADE FOUNDATIONS SHALL BE PLACED ON A TEN (10) MIL VAPOR RETARDER OVER EITHER TWELVE (12) INCHES OF SELECT FILL OR SIX (6) INCHES OF LIME STABILIZED CLAY SOIL. THE UNDERLYING SOILS SHALL BE PRESWELLED BY EITHER WATER PRESSURE INJECTION TO A DEPTH OF TEN (10) FEET OR MECHANICAL EXCAVATION/RECOMPATION TO A DEPTH OF EIGHT (8) FEET IN ACCORDANCE WITH THE PROJECT GEOTECHNICAL REPORT. IF WATER PRESSURE INJECTION IS USED, THE INJECTION PROCESS SHALL BE COMPLTED PRIOR TO THE BEGINNING OF EXCAVATION FOR THE PARKING GARAGE.
6. INFORMATION ABOVE IS PRESENTED ONLY AS A SUMMARY OF THE PROJECT GEOTECHNICAL REPORT. THE CONTRACTOR IS RESPONSIBLE FOR REVIEWING AND COMPLYING WITH THE RECOMMENDATIONS CONTAINED IN THE PROJECT GEOTECHNICAL REPORT.
7. IT IS RECOMMENDED THAT THE BUILDING OWNER RETAIN A QUALIFIED INDEPENDENT INSPECTION SERVICE TO VERIFY BEARING STRATA, LOCATION, DIMENSIONS, SELECT FILL PLACEMENT/COMPACTION AND REINFORCEMENT SIZE AND PLACEMENT.
8. BECAUSE OF THE ELAPSED TIME, THE CURRENT SOIL CONDITIONS MAY DIFFER SIGNIFICANTLY FROM THE SAMPLES THAT WERE USED IN THE DEVELOPMENT OF THE PROJECT GEOTECHNICAL REPORT REFERENCED ABOVE. THEREFORE, IT IS RECOMMENDED THAT THE BUILDING OWNER CONSULT WITH THE PROJECT GEOTECHNICAL ENGINEER TO DETERMINE IF THE FOUNDATION DESIGN PARAMETERS ARE CONSISTENT WITH THE CURRENT SOIL CONDITIONS.

STRUCTURAL CONCRETE NOTES

1. ALL CONCRETE WORK SHALL BE IN ACCORDANCE WITH THE LATEST EDITION OF ACI 301 AND ACI 318. ALL CONCRETE SHALL BE LABORATORY DESIGNED AND CONTROLLED.
2. UNLESS NOTED OTHERWISE, ALL CONCRETE SHALL HAVE SAND AND GRAVEL OR CRUSHED STONE COARSE AGGREGATES AND A CORRESPONDING TWENTY-EIGHT (28) DAY COMPRESSIVE STRENGTH OF 3,000 PSI. ALL CONCRETE THAT WILL BE PERMANENTLY EXPOSED TO WEATHER SHALL CONTAIN AN AIR ENTRAINING AGENT THAT PROVIDES FOUR (4) TO SIX (6) PERCENT AIR BY VOLUME.
3. CONCRETE ON WOOD DECK SHALL HAVE SAND AND LIGHTWEIGHT COARSE AGGREGATE AND A CORRESPONDING TWENTY-EIGHT (28) DAY COMPRESSIVE STRENGTH OF 3,000 PSI, UNLESS NOTED OTHERWISE. UNIT WEIGHT OF IN PLACE LIGHTWEIGHT CONCRETE SHALL NOT EXCEED ONE HUNDRED FIFTEEN (115) POUNDS PER CUBIC FOOT. CONCRETE SHALL BE REINFORCED WITH NYCON-RC FIBER REINFORCEMENT AS MANUFACTURED BY NYCON, INC. OR APPROVED SUBSTITUTE. Trent: Makerick framing our framing subcontractor has an RFI. We have reviewed the structural plans and have a question concerning the shear wall hold down/ anchorage. Pages S2.31 through S2.36 gives us shear wall types and locations for the different floor levels. The plans tell us that the first floor shear walls are type 1B. The 2nd, 3rd, and 4th floors are type 1A. Detail 5/S1.0 (shear wall schedule) tells us what the wall board application is and its nailing pattern. It also tells us what type of intermediate wall anchorage will be used. We do not see where any end wall anchorage (detail 6/S1.03) is called out. Is there any end wall anchorage? Are we missing something?

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

No. Based on our review of the drawings, no endwall anchorages are required.

Request: **Date Required: 8/21/2012**

We cannot find the substitution option on the schedule sheet S1.03 for anchor replacement for the sill plate anchors. In some cases the j-bolt anchors may have exceeded the 4'-0" max spacing or some may have not been placed within 12" of a corner section of the slab. Please give us the description of the type of anchor you would like us to use.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

Please use 1/2" simpson SET XP adhesive anchors with a minimum of 6 3/8" embedment placed in accordance with the recommendations of the manufacturer. Exercise extreme caution when drillinto post-tensioned concrete slabs to avoid damaging tendons ot archorages.

Would it be possible to get a beam/header schedule that shows the beam or header type for a particular opening?

Requested by: David Miller
Embrey Builders LLC

Response:

Per your request, we are providing the following minimum header sizes:

Opening Length	Minimum Header Size
0'-0" to 4'-0"	2-2x8
4'-0" to 8'-0"	2-2x10
8'-0" to 12'-0"	2-2x12

Please note these are minimum sizes only. If the header size noted in the framing plans is different that those noted above, the larger/stronger size shall be installed. For example, on the Roof Framing plans, the "G" headers shall be utilized, in lieu of the minimum sizes noted above.

A2 BEAMS
The A2 units have a 2x12 FB that intersects another 2x12 FB at a 45degree angle. There is no hanger noted at these locations.
Does this beam to beam connection need a hanger? Please refer to page S2.01 details #9 #10 #11 and #12. If a hanger is needed can we use a SUR410 / SUL410 or a HSUR410 / HSUL410? I have spoken to the truss co and they have said they cannot tell us if a hanger is needed or what size it should be.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

HSUR410/HSUL410 are acceptable.

Request:
Date Required: 3/28/2012

Stair 1 on S2.31 and Stair 9 on S2.33 call for a 3 1/2 x 11 1/4 PSL beam on one end of the stairs and no beam is called out on the other end. The other stair towers at that level do not call for that size beam. They have a note that refers all stair towers to 6/S2.07, which has different sized beams at both ends. Please check all stair towers and confirm the beam sizes to be used.

Request: **Date Required: 3/22/2012**
After reviewing the answer to RFI 72 and speaking with our plumber and you in your office today, we would like to propose using 1/2" carpet pad wrapped around any piping through beams as an alternative to installing sleeves as suggested.

Requested by: David Miller
Embrey Builders LLC

Response:

PPO takes no exception structurally. Please verify that this solution is acceptable with the Plumbing Engineer.

Subject: Slab at Club Poured Short

Drawing: S2.11, S2.13, A9.1
Cost Impact: None
Spec Section:
Schedule Impact: None

Request: **Date Required: 6/8/2012**

On the courtyard side of the Club, where the 45 degree angle is, the concrete slab form board was about 2 inches short right in the angle. Please provide a fix for the following:
1. How can the steel beam be positioned to carry the exterior wall of the floors above?
2. How can the slab be repaired so that we have the correct dimensions for the exterior wall of the clubhouse?

Requested by: David Miller
Embrey Builders LLC

Response:

Per the conference call on May 30, 2012, the beams will remain in the current locations indicated on the drawings and modifications made per the attached sketches. The columns will be attached to the embed plates at their current locations. The maximum offset of the column from its intended location on the structural drawings is two (2) inches. If this limit cannot be maintained with the current locations of the embeds, contact PPO for additional remedial recommendations.

Request: **Date Required:**

The following is in an email from our structural steel subcontractor:
There are several dimensions that will be needed. I've attached a drawing. They have most of the columns located, but don't have any #'s for the beam to beam connections. Anywhere there's an empty circle, I don't have that number. Not all are needed, I just need to know how to locate those connections and the couple of columns that aren't marked. Also, there is one connection where two big beams come into the same column. One of the beams will be sitting on the column and the other will attach to that beam, but I don't know which one is on the column. There is a small sketch of what I think it is going to look like. This is the club/fitness area, the same would apply to the leasing area where there are beam to beam connections

Requested by: David Miller
Embrey Builders LLC

Response:

* Attached are the requested dimensions.
* The W18x119 will rest on the column as indicated on the plan sheet. The W18x50 will attach to the W18x119 beam.
* These responses are specific to the items in this RFI. Questions pertaining to any other location on the project will be addressed on a case by case basis. If additional dimensions for other areas are required, please provide a sketch.

S2.11S shows steel columns in the 2 HR Occupancy Separation Wall. Please provide a detail showing how the 2HR wall transitions into the columns.

Requested by: David Miller
Embrey Builders LLC

Response:

There will be studs 1/2" away from the steel column (on both sides) when they occur in a wall. All steel columns will have intumescent paint on them. This paint is thin, but when exposed to heat, will expand. This is where the 1/2" offset comes from. Please factor in this 1/2" offset when applying drywall over a steel column.

S2.15 shows sloping concrete on the interior of the building entry from the courtyard. A3.1E does not show that. It only shows slope outside the door. S2.12 shows a slope down and then flat at the door. A3.1B does not show a slope. Please confirm which is correct for these two.

Subject: Raising piers on north wall

Drawing: S2.13P, S2.15P & 5/S3.04
Cost Impact: None

Spec Section:
Schedule Impact: None

Date Required: 3/22/2012

Request:
As per our conversation during our meeting at your office, we would like to propose a change in the top of pier elevations for the P9, P8 & P7 piers. After revelving the finished exterior grades on the landscape drawings 1C & 2C, we feel the top of pier elevation could be raised as follows:
P9 - 638' - 9 1/4"
P8 - 637' - 9 1/4"
P7 - 638' - 0"
By raising these it will also benifit the integrity of the perimeter storm drain line. We would also like a detail for using dowels & sonotube on the previously poured P9 piers.

Requested by: David Miller
Embrey Builders LLC

Response:

PPO takes no exception to raising the top of pier elevation as long as it does not conflict with external grades. Please verify with Architect/Civil Engineer that proposed top of pier elevations are acceptable.

Pier extensions should be formed with a sonotube form of the same diameter as the pier shaft and reinforced with 6-#7 verticals (drilled and grouted into the existing pier with a minimum of 13 1/8" of embedment in accordance with the manufacturer's recommendations) and #3 ties at 10" on center as noted in detail 1/S3.01.

At the 12" step down between pour #3 and pour #5 the forms for pour #3 got out of square to the east of the proper line. At our site meeting on 5/11 with PPO (Brande Parkey) we looked at possibly using a treated 2x12 shot or anchored into the face of the #3 slab. This would be used for additional bearing for the 3 1/2" stud party wall for #3. Attached is the location with the dimension showing the length of the treated 2x12. Please advise and respond.

Requested by: David Miller
Embrey Builders LLC

Response:

Attach vertical, pressure-treated 2x12's (cut so that the end of the 2x12's flushes out with the top of the concrete at the high side of the step) at 11 1/4" on center. Attach each piece of 2x12 with two 5/8"x6 1/2" Simpson Titen HD anchors (see sheet S1.1 for requirements) spaced at 6" on center vertically.

Request:
On the courtyard side of the Club, where the 45 degree angle is, the concrete slab form board was about 2 inches short right in the angle. Please provide a fix for the following:
1. How can the steel beam be positioned to carry the exterior wall of the floors above?
2. How can the slab be repaired so that we have the correct dimensions for the exterior wall of the clubhouse?

Requested by: David Miller
Embrey Builders LLC

Response:

Per the conference call on May 30, 2012, the beams will remain in the current locations indicated on the drawings and modifications made per the attached sketches. The columns will be attached to the embed plates at their current locations. The maximum offset of the column from its intended location on the structural drawings is two (2) inches. If this limit cannot be maintained with the current locations of the embeds, contact PPO for additional remedial recommendations.

Request: **Date Required: 10/23/2012**

Now that the concrete has been poured at the North West corner of section #1, our framing subcontractor has tried to place the order for the select structural cedar 8x8 posts. He is being told that this item is very rare and nearly impossible to get. We would have to buy a bundle and they would probably be 5 to 6 weeks out. Select structural DF would be 3 to 4 weeks out and would also have to buy it buy the bundle. Can we have an alternate? One suggestion would be to use a PSL column and wrap it or to use real trim columns. Please advise ASAP

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

PPO Response- PSL columns are structurally acceptable. The columns shall be 7" x 7" 1.8E PSL posts.

BGO Response- Walter Kilroy said in an email on October 20th that PPO suggestion of a PSL post is acceptable, and tit will be wrapped with Cedar. It will not be wrapped in Cedar. It will be wrapped in Stucco. These 3 columns will have a 1x6 capital, and a 1x4 base. The base will be held 3/8" off the finish concrete floor height and have backer-rod and sealant at the base.

Request: **Date Required: 11/20/2012**

At the B2 part 4 patio pier cap we raised the south side of the patio for positive drainage. By doing this, the poured pier cap beccame recessed below the finished patio slab by about 5". We need a fix to rise the top of the pier cap out of the elements for the column post to sit on.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

Per our conversation yesterday afternoon, please drill and epoxy grout in four #4x0'-8" dowels (with one #3 tie) into the existing pier cap and cast a new 6" tall cap extension.

Request:
Date Required: 4/19/2012

The P5 top of pier elevation at the SW corner of Pour 5 will not allow enough room for the ramp. FF should be at 640.1', which would mean we would have a shorter gradebeam than the typical 2'-0". Please confirm if we are to have an 18" gradebeam there and also confirm where the stepdown is from the P9 pier to the P5 pier. Also profide a detail or cut through that area.

Requested by: David Miller
Embrey Builders LLC

Response:

Step top of grade beam down 6" at ramp only. Grade beam depth to remain 24" at all other areas.

See 6/S3.01 for additional information.

Structural plans call for these posts to be 6" wood. Architectural calls for these to be 8". With the height of these columns (11 - 13 plus feet), should they be steel? Also, how do the structural beams attach to the columns, whether wood or steel?

Requested by: David Miller
Embrey Builders LLC

Response:

Per BGO, use 8x8 posts.
Fasten beams with Simpson CCQ Post Cap and to foundation with Simpson ABU Post Base.

Subject: Elevator Pit #2 Dowels

Drawing: S2.14 & 11/S3.03
Cost Impact: None

Spec Section:
Schedule Impact: None

Request: **Date Required: 5/24/2012**
Please provide a detail sketch showing the proper number and placement of dowels to tie the elevator back wall into the beam wall of the garage. S2.14 shows using 11/S3.03 at the NW & SW corner of the pit adjacent to the garage. Please provide a sketch for clarification purposes on the elevator wall butting into the garage.

Requested by: David Miller
Embrey Builders LLC

Response:
**While on site on Thursday, May 24, it was observed that the concrete subcontractor had drilled and epoxy grouted #4 dowels at approximately 18" o.c. horizontally and verticaily in the garage foundation wall to tie into the elevator pit wall. He was preparing to install 2-#4 dowels at 12" o.c. vertical in the garage foundation wall to tie into the intersecting elevator pit walls. Refer to the attached photo. The proposed solution is acceptable to PPO.
**It was also discussed while on site that the 8" wide elevator pit wall adjacent to the garage foundation wall shall be reinforced with #4 bars at 12" on center, each way, and centered in the wall.
**If you have questions or require additional information regarding this matter, please do not hesitate to contact us.

At the Southeast corner of Pour #12 there is a corridor into the building that is sloped to the outside. The plans do not call for the piers or the beam to be lower at that area. This will cause the slab to be less than 10". Brande Parkey was on-site 6/4/12 for this grade beam inspection and directed us to leave out this section unitl a solution was decided. Please advise.

Subject: Confirmation of no low roof at south entry to the west building

Drawing: S2.22, S2.23, S2.42, 3/S5.02, 3.2B, 3.3B, 3.4B, 1/4.1, 5/8.6A
Spec Section:

Cost Impact: None
Schedule Impact: None

Request: **Date Required: 11/3/2012**

We need to confirm that there is no low roof at the south entry to the west building. S2.22 shows a 5 ¼" x 14" PSL D.B. & low roof framing and trusses. S2.23 shows open to below which would mean no low roof framing. S2.42 shows roof trusses with 3 ½" x 11 ¼" D.B. Ref. 3/S5.02 which shows roof detail. 3.2B, 3.3B, & 3.4B shows open to below which would mean no low roof. 1/ 4.2 shows no low roof, 5/ 8.6A shows no low roof. Please confirm there is no low roof in this area.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

Structure's drawing need to be updated to coordinate with architecture. The only roofs in this entry are the metal canopy on the 1st floor, and the main roof above the 4th floor. Because of RFI-035, any water that blows in behind the metal awning will fall on sloped concrete and drain away from the building.

Subject: Floor Truss Support at A2-SP Unit

Drawing: S2.23 & S2.33
Cost Impact: None
Spec Section:
Schedule Impact: None

Request: **Date Required: 5/25/2012**
The 2nd floor plan on S2.23 will work with the steel beams supporting the trusses above. The 3rd floor plan on S2.33 shows the trusses to span from the corridor wall to the exterior wall of the A2-SP unit. Please confirm that the steel support below will support the trusses bearing on the exterior wall for the units above.

Requested by: David Miller
Embrey Builders LLC

Response:

As discussed on site, the W16x36 and W16x77 beams have been designed to "cantilever" through the W24x76 beam using a "moment connection" as shown in detail 4/S4.01.

An additional plate is required at the W10x12 per attached.

Request: **Date Required: 6/8/2012**
Please provide the dimension of the cantilevered beams clouded on the attached drawings. This is over the garage entry. We have requested this info from BGO and were told that PPO should provide it.

Requested by: David Miller
Embrey Builders LLC

Response:

Please see attached. Note that the dimension is based on the architectural dimension shown in red and a corridor width of 7'-4". We recommend that all parties involved review the dimension prior to beam construction to ensure that we are all in agreement on the dimensions.

Subject: Wood Beams Connecting to Steel Beams

Drawing: S2.23
Cost Impact: None
Spec Section:
Schedule Impact: None

Request: **Date Required: 6/20/2012**
There are several places where a wood beam is connected to a steel beam. The truss company has stated that the wood beam can be placed inside the web of the steel beam and rest on the bottom web. The wood beam would then be padded up to reach the floor level. We could also pad underneath the wood beam to bring the top of the beam up to floor level. The wood beam would have to be notched at the top web. Please let us know which method would be acceptable or if there is another method. Also provide any details needed or connections required.

Requested by: David Miller

Response:
Per conference call on June 13th, please utilize pre-manufactured, top flange beam hangers to support beams.

PPO takes no exception to the cantilevered truss solution proposed below.

Please ask BGO to confirm that the solution is acceptable Architecturally.

BGO suggests cantilevering the trusses for these B2 units in question as shown in the next pages of this PDF only if the Trusses are signed and sealed by an engineer in the state of Texas.

There is a conflict between the structural plans and the architectural's at stair tower #8. See the following and pleas clarify.
1. S2.25 shows low roof framing over the 1st floor and no storefront at the exterior wall.
2. S3.25 shows no exterior triple window only single window at stairs.
3. S4.25 shows roof deck extending to exterior of building with no window below.
4. 3.2E, 3.3E, & 3.4 E shows clear opening between exterior Q window and stairwell. This clear opening would go from the slab to the bottom of the roof trusses. The exterior storefront and triple windows would match the building elevations on 4.1 & ¼.4 and the roof would match 3.5E
5. There is no stair section in the architectirals to refer to for stair #8. (all other stairs have stair section)
6. Is there a single window AA in stair tower and triple window Q at exterior wall

Request: **Date Required: 2/27/2012**

We have some questions concerning the CMU stair towers #4 & #5. (1) Page S2.24 has a cut through stairwell #4. This cut directs us to detail #6 on page S2.07. Detail #6 directs us to details #14 & #15 on page S4.02. These details (14 & 15) are wood to wood connections. We will need a wood to CMU connection detail for this application. (2) I have not seen a detail for the window in CMU application. Will there be 2x framing in the window openings? We would also like to confirm that the landings in the 2 CMU stair towers are in fact wood. It has been our experience that the landings in these type assemblies are usually metal.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

Landings at CMU stair towers are to be wood framed.

Please see attached details for attachment of 2x landing framing to CMU walls.

Wood beams at the that support the stair stringers shall be attached to the CMU wall with HU410 beam hanger fastened to CMU wall with 18-1/4x2 3/4" Titen HD anchors installed in accordance with the manufacturer's recommendations. All vertical cells in CMU walls at beam hangers shall be fully grouted over the height of the wall.

Please refer question about window framing to BGO.

I want to make sure that the increase size of the elevator shaft was taken into consideration for required clear width between lobby angle wall and north east corner of the elevator shaft wall. The elevator was made 2" bigger in width with both 2" added to the north. Schindler Elevator said they had to have min 8'- 5" and we made both elevators 8'-6" in width.

PPO rresponse: BGO to provide response.

BGO: the interior clear dimension on the BGO plans is 8'-5". if you have constructed the elevator shaft at 8'-6" this is acceptable.

S2.1 shows the shortest new grade beam location north of the elevator. This new grade beam is located under a critical load bearing triple girder that supports the corridor floor trusses. The supporting stud packs for this girder will have to be removed to cut and remove existing slab and install new grade beam. Please provide a temporary bracing detail for this area so we can proceed.

Requested by: Bryan Pickler

Response:

Temporary shoring and bracing is the responsibility of the contractor. PPO recommends that Embrey contact a qualified shoring sub-contractor for direction on this process.

Response:

PPO takes no exception to the cantilevered truss solution proposed below.

Please ask BGO to confirm that the solution is acceptable Architectually.

BGO suggests cantilevering the trusses for these B2 units in question as shown in the next pages of this PDF only if the Trusses are signed and sealed by an engineer in the state of Texas.

"IMPORTANT" READ AND FOLLOW ALL NOTES ON THIS DRAWING
"IMPORTANT" FURNISH THIS DRAWING TO ALL CONTRACTORS INCLUDING THE INSTALLERS
Trusses require extreme care in fabricating, handling, shipping, installing and bracing. Refer to and follow the latest edition of BCSI (Building Component Safety Information), by TPI and SBCA. Unless noted otherwise, the building designer is responsible for temporary and permanent bracing of the roof system and all the trusses. Temporary bracing must be installed as noted in the bracing plan. Permanent bracing must be installed as noted in the bracing plan. Bracing shown is for truss stability only. Provide temporary and permanent bracing per BCSI to ensure that the roof and ceiling systems have adequate stability. Any bracing shown is a minimum recommendation. Additional bracing may be required by the building designer or building code. Refer to BCSI for more information on bracing. Do not walk on trusses without adequate temporary and permanent bracing installed. Failure to follow these instructions may cause property damage or serious personal injury or death. Unless noted otherwise, the design does not consider any additional loads due to ponding, impact, vibration, rain on snow surcharge, cantilevers, special loads, concentrated loads, etc. Design assumes adequate drainage is provided. Camber is a manufacturing option to counteract anticipated deflection; however, excessive camber may be detrimental to the truss and/or building performance. Locations of splices are approximate unless dimensioned. Review and approval of this truss design drawing must be received from the building designer before any fabrication or construction begins. Any modifications to this truss design drawing must be approved by a registered design professional. Verify that the information contained in this truss design drawing is suitable for use with the building design. It is the responsibility of the Building Designer per ANSI/TPI 1 Sec. 2.
Design assumptions and notes regarding permanent and temporary bracing are the responsibility of the Building Designer per ANSI/TPI 1 Sec. 2.
Truss Design Drawing shall not be used without the Seal and Signature of a Registered Professional.
Design Drawing Number and Truss Identification must be shown on each truss and on the placement drawing.
Review and approval of this truss design drawing must be received from the building designer before any fabrication or construction begins.
Any modifications to this truss design drawing must be approved by a registered design professional.
Verify that the information contained in this truss design drawing is suitable for use with the building design.

Subject: Structural support for the radius feature above B3 unit

Drawing: S2.41, 3/S5.02, 3/7.7, 3/5A, truss drawings R02

Spec Section:

Cost Impact: None

Schedule Impact: None

Request: **Date Required: 9/28/2012**

On the very northwest corner of turn section #2 we have the radius canopy feature on the roof. This area is located on the structural plans on sheet S2.41 and 3/S5.02. On structural sheet 3/S5.02 it is shown tied into the actual ceiling truss. However, on Panel Truss's approved drawings these are two separate trusses and they are not tied in. This is shown on Panel Truss sheet R02. I have drawn a very rough sketch showing how it's built and have concerns about proper anchoring of the piggy back trusses for wind shear. What you have is the flat ceiling trusses over the B3 unit with plywood roof decking. The flat trusses are R187- R197. Then on top of the roof decking you have the 870 piggy back trusses which form the radius feature. The problem I have is the R870 trusses need to be properly secured structurally for wind shear. I have spoken to Red River about this and they said Bob Cincar with Panel Truss said they had to design it this way. They also said that PPO would need to determine how we secure it and what type of anchors, straps or clips will be needed.

Attachments = Rough sketch
Photos #1= view of the upper R870 trusses on top of decking which is on top of the R 187- R197 trusses
Photo #2= another view of the R870 on decking over the B3 unit ceiling trusses
Photo #3= the approximately 2' diameter inter-circle where the R 870 meet in center
Photo #4= another view angle
Photo #5= a view of the feature from a distance
Photo #6= a view of the R187- R 197 trusses from inside the unit below.

Response:

Attach exterior ends of all piggy back trusses to framing/trusses below with CS18 coil strap. At interior end and along the length of all piggy-back trusses, attach to trusses/truss blocking (thru decking) at 24" on center with Simpson HGA10 clips. Fasten to piggy-back trusses with 4-SDS 1/4" x 1 1/2" screws. Fasten to supporting framing (thru decking) 4-SDS 1/4" x 3" screws.

Response:

PPO takes no exception to the cantilevered truss solution proposed below.

Please ask BGO to confirm that the solution is acceptable Architecturally.

Request: **Date Required: 4/12/2012**
There are several places on these sheets (there may be other sheets where this occurs) where a gradebeam changes elevation due to changes in top of pier elevation. On 2.11P, there are two entries into the building on the left side - one from the courtyard and one from the outside. The courtyard shows P6 piers that change to a P6A pier. Please provide details for this condition. A different condition would be on S2.13P where the interior piers (between Pours 3 and 5) are a P5 and the exterior pier is a P9. Please provide a detail showing how the grade beams come together.

Request: **Date Required: 3/22/2012**
In our meeting on 3/16/12 at your office we discussed the already poured piers on slab pour #1 as having 4-#6x6'-0" dowels as shown on 1/S3.01 vs the proper detail as shown on 3/S3.02, which requires 6 #7 dowels. You were going to check to see if we can reduce the required number of #7 dowells to go along with the in place #6 dowells.

Requested by: David Miller

Response:

Please provide 4 - 7 "L" dowels in addition to the 4-#6 dowels currently in place.

There are several places on these sheets (there may be other sheets where this occurs) where a gradebeam changes elevation due to changes in top of pier elevation. On 2.11P, there are two entries into the building on the left side - one from the courtyard and one from the outside. The courtyard shows P6 piers that change to a P6A pier. Please provide details for this condition. A different condition would be on S2.13P where the interior piers (between Pours 3 and 5) are a P5 and the exterior pier is a P9. Please provide a detail showing how the grade beams come together.

Brian –

Yes, it is acceptable to terminate the building piers once they have achieved the 5 feet of penetration into the bearing strata as determined by the geotechnical engineer per the structural drawings. If you have questions or require additional information regarding this matter, please do not hesitate to contact us.

Brande ,

Does the same principal hold for the building piers. I know we dug a test hole in the courtyard of the East bldg. and hit rock at about 8 ½' from F.F. We did the same thing on the West Bldg. and hit rock around 12'. Just wanted to confirm that 5' into Grey Limestone was sufficient.

Thanks,

Brain –

Per our discussion, the 17'-0" minimum depth requirement indicated in 1/SG3.01 does not need to be met provided that the piers penetrate a minimum of 5'-0" into the bearing strata as indicated on the structural drawings. If you have questions or require additional information regarding this matter, please do not hesitate to contact us.

Request: **Date Required: 8/14/2012**

Trent,

We still have a question on the transition 6" step on #19. You had previously said that the soffit of the 10" slab and the 18" area was the same and that is the way detail 9/S3.04 shows it. However, the step is only 6" so when that is added to the 10" slab coming into the thickened area you only get 16" not 18". If you look at 10/S3.04 that detail does not reflect our situation on this pour.
Please advise ASAP

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

You are correct. The slab thickness in this area should be 10" + 6" = 16" not 18". The 18" dimension in 10/S3.04 should be 16" instead.

Party Walls

Details 1 & 2 on page 7.1 of the architectural drawings shows the wall make up to have 1 sheet of plywood in the middle of the double walls. The note tells us to refer to the structural drawings for the nailing pattern. Pages S2.31 through S2.36 gives us the shear wall designations. Our shear walls are types 1A & 1B. The shear wall schedule on page S1.03 tells us that the shear wall sheathing on types 1A & 1B is 1 layer of 5/8 gypsum wall board applied to 1 face of the wall. I cannot find where the shear wall schedule requires 15/32 plywood as a component of the double party walls. There are some details in the structural drawings on page S4.02 that show 15/32 sheathing but again it is not noted as a structural component. Please confirm that this was the correct understanding or not. (Is OSB required as part of the double party wall make up?)

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

The 15/32" APA Rated Sheathing (noted in the Architectural drawings and in details 9, 10, and 11 on sheet S4.02 and details 5, 6, and 7 on sheet S5.01) is not part of the shear-wall assembly.

If the contractor provides adequate temporary bracing of the structure, the sheathing is not required structurally.

We have some questions concerning the CMU stair towers #4 & #5. (1) Page S2.24 has a cut through stairwell #4. This cut directs us to detail #6 on page S2.07. Detail #5 directs us to details #14 & #15 on page S4.02. These details (14 & 15) are wood to wood connections. We will need a wood to CMU connection detail for this application. (2) I have not seen a detail for the window in CMU application. Will there be 2x framing in the window openings? We would also like to confirm that the landings in the 2 CMU stair towers are in fact wood. It has been our experience that the landings in these type assemblies are usually metal.

Requested by: Bryan Pickler

Response:

Landings at CMU stair towers are to be wood framed.

Please see attached details for attachment of 2x landing framing to CMU walls.

Wood beams at the that support the stair stringers shall be attached to the CMU wall with HU410 beam hanger fastened to CMU wall with 18-1/4x2 3/4" Titen HD anchors installed in accordance with the manufacturer's recommendations. All vertical cells in CMU walls at beam hangers shall be fully grouted over the height of the wall.

Because of the conflict between garage expansion joint demension between Architcturals and the structurals the possibility of lay-out errors looms large. We need to have a forming plan that is reviewed and agreeded upon by the architech and structural engineers. This plan should include building section envelopes for the surveyor to layout form for our contractors to form by. Attached is a copy of the 1st section of the main building we are going to form. It is marked with points I believe we need to get set by the surveyor to form by. I believe a forming plan would help correctly locate these points and eliminate errors. The attachment is the proposed pour sequence we are intending to go by.

Requested by: Bryan Pickler
Embrey Partners, Ltd.

Response:

With the most current drawings there is not a conflict with the 2" expansion joint between the garage and the apartments as it is shown correctly on the architectural and structural plans.

The design team has fully reviewed the foundation plans and forming plans and the Architect and Structural engineer do agree that these plans match the framing plans. The garage limits, I would suggest, to be used as your control points. To ensure proper layout in the field we will be glad to provide a cad file to your surveyor if you would send along his contact info we can send him the file. Please be advised this has been the standard of care by all contractors in the recent past for a building of this size and complexity.

Sheet PC-01 shows a (+9'-2 1/8") at the intersection of grid B and the top of the ramp wall at grid 3.66 SG2.02 shows this same area as being 10'- 2 1/8". By doing the math on this area I believe 10'- 2 1/8" is correct. PC-01 also shows on the south end of the ramp wall at the intersection with grid C (+9' - 8 1/8"). SG2.01 shows this to be 10' - 8 1/8". Again, I believe SG2.01 is correct. Please confirm and correct.

Requested by: Bryan Pickler

Response:

The +9' - 2 1/8" on PC-01 is T/slab relative to level 1 fin. floor. (640' - 7 1/4" + 9' - 2 1/8" = 649' - 9 3/8") @ line B. The 10' - 2 1/8" shown on SG2.01 is the step in the wall. (649' - 9 3/8" - 639' - 7 1\4" = 10' 2 1/8"). At line C it is similar. T/slab + 9' 8 1/8"= 650' - 3 3/8" step @ this location is 10' - 8 1/8" (650' - 3 3/8" - 639' - 7 1/4"). As previously discussed, there was a question in regards to the number of L-bars from top of pier and into the pier cap. Our concrete man felt that detail 3/S3.02 was calling for (2) #7 L-bar dowels (one on each side of column). We found out there were six L-bars supposed to be coming from the pier cap. Request: **Date Required: 3/5/2012**
Along grid #9 where we step the wall up 2'-0" we are shown to reference 7/SG3.02 all along that grid and grid C to 11' south of grid #4. Shouldn't there be another detail other than 7/SG3.02 from the 2'-0" step up at the beginning of the ramp on grid #9 over to grid #8 on C line? 7/SG3.02 shows the top of wall and the top of paving slab at being equal. This does not occur at the 2' ramp between grids #8 and #9. It also does not occur at the 43' X 24' landing area between the 2' ramp and the long ramp. That landing area has a finish elevation of 642' - 7 ¼" and the top of wall is 641' - 7 ¼". It looks like we have to have a leave out along the exterior and pour it after the panel is in place. Is that correct?

Requested by:

Response:
An additional section is not required. The top of concrete elevation for the slab on grade is called out as "varies - ref plan." The section also notes that the #5 dowels may be omitted when the top of concrete elevation of the slab is above the top of wall elevation. The slab leave out is a means and methods question and shall be left to the discretion of the Contractor.

The pour strip indicated in section 4/SG3.02 shall have the same reinforcement as the concrete topping for the double tees. The minimum thickness shall match the topping thickness of the double tees. The purpose of the leave-out in section 4/SG3.02 as indicated on the drawing is to match the top of concrete elevation with the camber of the double tees.
