- B Intersection Analyses
- C Cost Estimates and Quantities

## INTRODUCTION

This Design Report documents the planned improvements, traffic analyses, and design review findings associated with nine intersections located in the Cities of Carrollton, Dallas and Farmers Branch, and the Town of Addison, Texas. The nine intersections under study are:

- Trinity Mills Road at Midway Road
- Spring Valley Road at Midway Road
- Keller Springs Road at Midway Road
- Beltway Drive at Midway Road
- Lindberg Drive at Midway Road
- McEwen Road at Midway Road
- Proton Drive at Midway Road
- Belmeade / Sojourn at Midway Road
- Boyington / Dooley at Midway Road

*TTA will DO  
incorporate  
improvements*

*Signal already  
constructed*

The study includes data collection, traffic analyses, and design issues related to minimum TxDOT standards.

### Data Collection

Peak hour counts, including truck and pedestrian data, were taken at all nine intersections. The counts were conducted for the hours of 7:00 to 9:00 A.M. and 4:30 to 6:30 P.M. The traffic volume count summaries are provided in Appendix A.

Additional field data was collected on existing signal phasing, lane usage, turn lane lengths for vehicle storage, and any observed operational characteristics that may be significant.

As-built intersection plans were provided by the Cities of Carrollton, Dallas and Farmers Branch, and the Town of Addison.

Traffic signal coordination plans are not included in this project, but optimal coordination of the signals is assumed. Existing signal coordination is in place and is maintained by each City.

### Traffic Analyses

The traffic operations analyses were performed using procedures outlined in the 1994 Highway Capacity Manual for signalized and unsignalized intersections. The AM and PM peak hours were analyzed for both existing and proposed conditions. Existing conditions assumed the existing phasing sequences with timing adjustments to provide optimum outputs. Proposed conditions considered both phasing and timing adjustments which would provide optimum solutions for the proposed geometrics.

The operations analyses were performed using the CINEMA 3.0 software package for the signalized intersections and the HCS software package for the unsignalized intersection. Appendix B contains the detailed analyses outputs.

Table 1 summarizes the capacity analysis results, the level of service and the reduction in delay for each of the intersections. A summary of the projected emissions and travel time benefits resulting from the proposed improvements are shown in Table 2.

V/C = Volume / Capacity

**Table 2**  
**Emissions and Travel Time Benefits Summary**

Midway Road Intersection	Benefits with Recommended Improvements	
	Annual Hydrocarbons Emissions Reduction in Pounds HC / Year	Annual Travel Time Savings in Dollars / Year
Trinity Mills Road	7,049	\$168,170
Spring Valley Road	7,242	\$288,100
Keller Springs Road	1,014	\$59,980
Beltway Drive	11	\$3,720
Lindberg Drive	4,048	\$113,970
McEwen Road	569	\$44,740
Proton Drive	820	\$26,630
Belmeade/Sojourn	3,411	\$108,910
Boyington/Dooley	3,774	\$185,630
<b>Totals:</b>	<b>27,938</b>	<b>\$999,850</b>

\* Note: Travel time savings per year were calculated for the AM and PM peak hours only, and weekdays only. Dollar value of time was assumed at \$7/hour. The hydrocarbon savings for Boyington/Dooley was assumed at 100 grams for both peak periods. No actual value for existing was available with no signal at the intersection.

### Design Issues

Design drawings have been developed based on the traffic analysis for each intersection. Construction cost estimates and the corresponding project budget is summarized in Table 3. Every attempt has been made to work within the original budget that was established by the Dallas County CMAQ Program office, while also maintaining the established design standards and criteria. Minimum design criteria and standards have been met throughout the project, and desirable standards have been met where possible.

Table 3 shows that some individual projects have exceeded their specified budget, the most significant of which is Trinity Mills Road. However, several projects are also shown to come in below their specified budgets, which would allow the overall budget to be met if the funds could be redistributed.

**Table 3  
Construction Cost Estimates and Project Budget**

Intersection	Jurisdiction	Construction Cost	ROW Cost	Other Costs*	Project Budget	Under (Over) Budget
Trinity Mills Road	Carrollton/Dallas	\$558,937	\$248,184	\$196,524	\$750,000	(\$253,645)
Spring Valley Road	Addison/Farmers Branch	\$443,394	\$156,060	\$183,620	\$1,750,000	\$966,926
Keller Springs Road	Carrollton/Addison	\$292,865	\$156,060	\$106,261	\$530,000	(\$25,186)
Beltway Drive	Addison	\$29,785	\$12,204	\$10,834	\$55,000	\$2,177
Lindberg Drive	Addison	\$58,582	\$13,932	\$21,231	\$105,000	\$11,255
McEwen Road	Farmers Branch	\$94,316	\$27,000	\$32,885	\$115,000	(\$39,201)
Proton Drive	Addison/Farmers Branch	\$103,391	\$33,372	\$35,783	\$115,000	(\$57,546)
Belmeade/Sojourn	Carrollton	\$167,888	\$68,256	\$58,903	\$220,000	(\$75,047)
Boyington/Dooley	Addison/Carrollton	\$55,479	\$23,976	\$21,439	\$155,000	\$54,106
Totals:		\$1,804,637	\$739,044	\$667,481	\$3,795,000	\$583,838

NOT BUILT  
BY CMAQ

\* Other Costs consist of 20% PS & E cost plus County and State construction/administration costs as listed in Appendix C.

# SPRING VALLEY ROAD

## Existing Conditions

Analysis of the existing traffic conditions at the Midway Road intersection with Spring Valley Road shows operations at LOS "E" for the AM peak and LOS "F" for the PM peak hour. Each of the four approaches currently have an exclusive left turn lane. The northbound and southbound approaches also have an exclusive right turn lane. Both roadways have six-lane cross sections. Existing peak hour traffic counts are shown in Figure 2.

## Proposed CMAQ Improvements

The proposed CMAQ improvements would result in all four approaches having dual left turn lanes and an exclusive right turn lane. The analysis of these improvements show LOS "D" operations for the AM and PM peak hours, with room for some growth in traffic. Recommended storage lengths are shown in Table 6. Table 7 lists the design criteria used for the geometric design of the intersection.

Midway Road is currently under design for widening to an eight-lane roadway between LBJ Freeway and Spring Valley Road. The current design for this widening is accounted for in the geometrics for the intersection.

**Table 6**

## KELLER SPRINGS ROAD

### Existing Conditions

Analysis of the existing traffic conditions at the Midway Road intersection with Keller Springs Road shows operations at LOS "E" for the AM peak and LOS "D" for the PM peak hour. Each of the four approaches currently have an exclusive left turn lane. The eastbound approach has an exclusive right turn lane and the northbound and southbound approaches also have short right turn separations. Keller Springs Road is a two-lane roadway on the east side and a four-lane roadway on the west side. Midway Road has a six-lane cross section. Existing peak hour traffic counts are shown in Figure 3.

### Proposed CMAQ Improvements

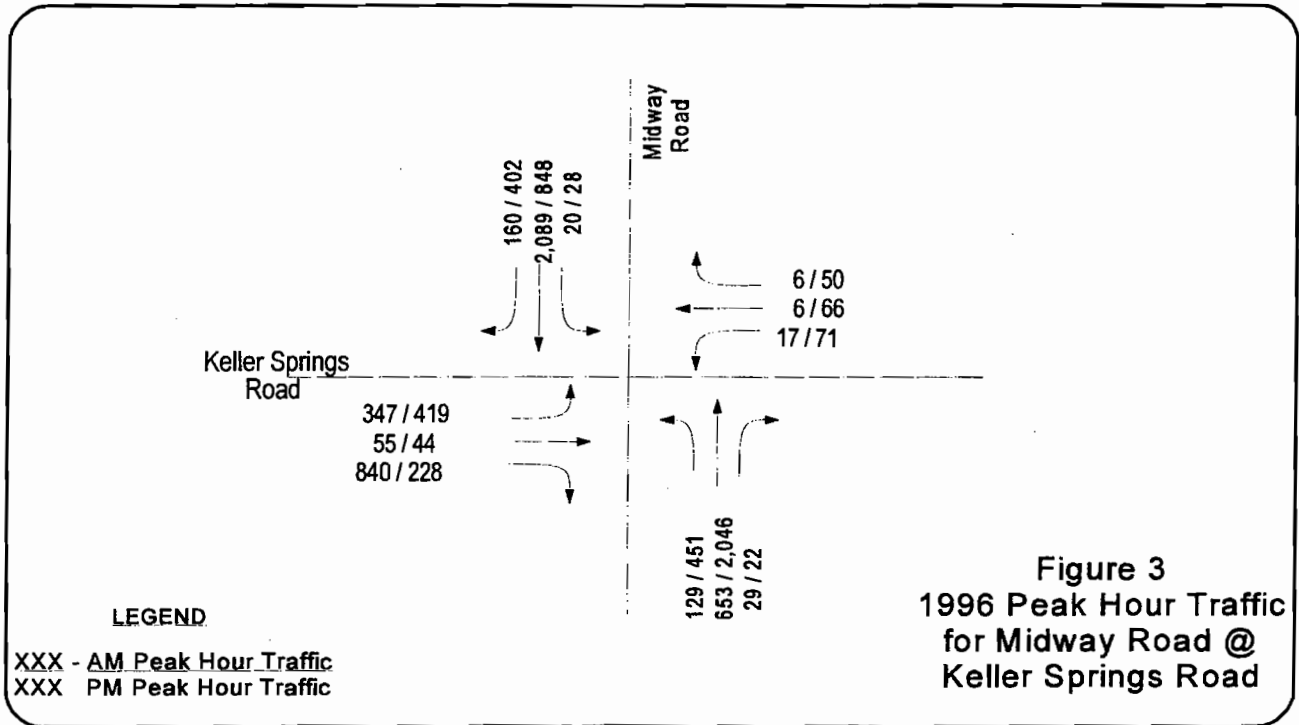

The proposed CMAQ improvements include widening the northbound, eastbound and southbound approaches to include dual left turn lanes and an exclusive right turn lane. The eastbound approach would also be widened to include two through lanes, which would narrow quickly to one lane on the east side. These improvements showed intersection operations would be at a LOS of "F" in the AM peak hour and LOS "C" in the PM peak hour. Although the physical capacity increases with the proposed geometric improvements, the worsening of intersection operations in the AM peak is due to the change in signal phasing as a result of the dual left turns and the heavy eastbound right turn movement. The dual left turn lanes prohibit the use of permissive left turns on the green phase for the through and right turning traffic. Therefore, due to the fact that the 840 right-turning vehicles requires a significant portion of the green time, the left-turning traffic actually has less opportunity per cycle, even though there would now be two lanes to move and store the traffic in.

### Additional Improvements

The existing eastbound through volume (less than 100 vehicles during the peak hours) does not currently warrant two lanes. Therefore, it is recommended that the existing lane balance be maintained by carrying only one eastbound through lane across the intersection. It is also recommended that a dual right turn be installed for the eastbound approach. This would still result in recommending the widening of the eastbound approach to five lanes but with the following geometrics: a dual left turn, one through lane and a dual right turn. These changes to the recommended improvements would result in operations of LOS "D" in the AM peak and LOS "C" in the PM peak. The recommended storage lengths are shown in Table 8. Table 9 shows the design criteria used for the geometric design of this intersection.

Once the portion of Keller Springs under Addison Airport is opened, a re-evaluation of the lane assignments will be necessary.

CONSTRUCTION OF SIGNAL WILL  
BE DONE BY NTTA

# BELTWAY DRIVE

## Existing Conditions

Analysis of the existing traffic conditions at the intersection of Midway Road and Beltway Drive shows operations at LOS "D" for the AM peak and LOS "C" for the PM peak hour. Each of the four approaches currently have an exclusive left turn lane. The eastbound, northbound and southbound approaches each have an exclusive right turn lane. Beltway Drive is a two-lane roadway. Midway Road has a six-lane cross section. Existing peak hour traffic counts are shown in Figure 4.

## Proposed CMAQ Improvements

The proposed CMAQ improvements include lengthening the storage lengths for the northbound and westbound turn lanes. The proposed restriping/marking for the eastbound approach is currently in place. These improvements would result in maintaining the intersection operations at the same LOS, but with slightly less average delay per vehicle in the AM peak. The recommended storage lengths are shown in Table 10. Table 11 shows the design criteria used for the geometric design of this intersection.

**Table 10

## LINDBERG DRIVE

### Existing Conditions

Analysis of the existing traffic conditions at the intersection of Midway Road and Lindberg Drive shows operations at LOS "D" for the AM peak and LOS "F" for the PM peak hour. The northbound and southbound approaches currently have an exclusive left turn lane. The eastbound and westbound approaches each have an exclusive right turn lane. Lindberg Drive is a two-lane roadway, east of the intersection and a three-lane roadway west of the intersection. Midway Road has a six-lane cross section. Existing peak hour traffic counts are shown in Figure 5.

### Proposed CMAQ Improvements

The proposed CMAQ improvements are to widen the westbound approach to include an exclusive left turn lane and to increase the right turning radius for the northbound approach. The eastbound approach is shown in the schematic as currently having an exclusive left turn lane and a through right lane. However, a field survey showed the existing signing and markings for a through-left lane and an exclusive right turn lane. With the addition of an exclusive left turn lane on the westbound approach, it would be advantageous to complement the left turn movement with an exclusive left turn lane on the eastbound approach. The proposed CMAQ improvements, in combination with restriping the eastbound approach for an exclusive left turn lane and a through-right lane, would result in a LOS of "C" for the AM peak and LOS "D" for the PM peak.

### Additional Improvements

There is capacity available for some traffic growth with the proposed CMAQ improvements, but the eastbound and westbound approaches would still be operating at LOS "F" and "E", respectively, in the PM peak. Alternatives were evaluated with the goal of providing a more balanced LOS for each of the approaches as well as an acceptable LOS for the intersection itself.

The first alternative consisted of adding a dual left turn at the southbound approach along with the proposed CMAQ improvements and increasing the storage lengths for many of the turn bays. This resulted in approximately the same average delay for the overall intersection, but the LOS for each of the separate approaches was more balanced, with the northbound, eastbound and westbound approaches at LOS "D" and the southbound approach at LOS "C" in the PM peak.

The second alternative added a right turn to the eastbound approach along with the proposed CMAQ improvements. The resultant evaluation showed the overall intersection LOS as "C" in the AM and PM peaks, with the eastbound and westbound approaches at LOS "D" in the PM peak. All other approaches are at LOS "C" or better. This represents a better result than the proposed CMAQ improvements appear to promote, but would also be more costly. Recommended storage lengths are shown in Table 12. Table 13 shows the design criteria used for the geometric design of this intersection.

# PROTON DRIVE

## Existing Conditions

Analysis of the existing traffic conditions at the Midway Road intersection with Proton Drive shows operations at LOS "C" for the AM peak and LOS "D" for the PM peak hour. The northbound and southbound approaches currently have an exclusive left turn lane. The eastbound approach has an exclusive right turn lane. Proton Drive is a three-lane roadway. Midway Road has a six-lane cross section. Existing peak hour traffic counts are shown in Figure 7.

## Proposed CMAQ Improvements

The proposed CMAQ improvements include widening the existing two lanes on the westbound approach and restriping these lanes to an exclusive left turn lane and a through-right lane. The eastbound approach is proposed to be widened to include dual right turn lanes and a through-left lane. These improvements showed intersection operations would improve slightly but the LOS would still be "C" in the AM peak hour and "D" in the PM peak hour.

## Additional Improvements

Various phasing alternatives were tested for different geometric alternatives, including the proposed CMAQ improvements. However, analysis showed that the existing laneage could be used along with restriping of the westbound approach, improved signal phasing, and increased storage lengths. The westbound approach would be restriped to match the existing eastbound approach for an exclusive right turn lane and a through-left lane. This alternative would provide operations at LOS "C" for the AM and PM peak hours. The recommended storage lengths are shown in Table 16. Table 17 shows the design criteria used for the geometric design of this intersection.

**BOYINGTON / DOOLEY**

IMPROVEMENTS ARE COMPLETE

Existing Conditions

Analysis of the Midway Road intersection with Boyington Drive and Dooley Drive shows operations at LOS "F" for the AM and PM peak hours. The intersection is stop sign controlled for the eastbound and westbound approaches. The northbound and southbound traffic is heavy enough to prevent adequate gaps in the traffic for the eastbound and westbound traffic to travel through the intersection. The northbound and southbound approaches (Midway Road) each have an exclusive left turn lane, but again the gaps in traffic are not sufficient for all of the left turning traffic to make it through the intersection in a reasonable amount of time. The eastbound approach has an exclusive right turn lane. Boyington and Dooley Drives both have two-lane cross-sections outside of the intersection. Midway Road has a six-lane cross section. Existing peak hour traffic counts are shown in Figure 9.

Proposed CMAQ Improvements

The proposed CMAQ improvements are to signalize the intersection and to provide an exclusive right turn lane for the eastbound approach and an exclusive left turn lane for the westbound approach. These improvements would involve some widening of the turning radii, but the roadway widths will support an additional lane with new pavement markings and channelization markings. The AM peak hour LOS would be "A" and the PM peak hour operations would be LOS "B" with these improvements. Due to another improvement project in the area, the signal is scheduled to be in place before the CMAQ project is scheduled. Therefore, the cost of the signal improvement is not included in the intersection costs. Recommended storage lengths are listed in Table 20. Table 21 shows the design criteria used for the geometric design of this intersection.

## CONCLUSIONS

Traffic operations analyses were performed for each of the nine Midway Road intersections to provide optimum operations for the cost of improvements to each intersection. All intersections will meet the minimum level of service "D" standards for the AM and PM peak hour with the recommended improvements, as shown in Table 22 on the following pages.

A summary of the estimated costs for each intersection is shown in Table 23. This table shows that the estimated costs for improvement will exceed the budget for the Midway Road intersections at Trinity Mills Road, Keller Springs Road, McEwen Road, Proton Road, and Belmeade/Sojourn. The estimated costs for the other four intersections come in under their respective budgets. The listing of design elements and estimated costs included for each intersection are given in Appendix C and the design elements are shown on the schematic design drawings.

All nine intersections within the Midway Road corridor will meet or exceed the minimum design standards from the TxDOT Operations and Procedures Manual and the AASHTO standards from the 1994 edition of design standards. Wherever possible, the recommended standards were used.

Table 22 (Cont'd.)  
Summary of Intersection Geometrics for Midway Road CMAQ Projects

Intersection	Approach	Existing							Proposed CMAQ Improvements					Final Recommended Improvements					Comments							
		Geometrics		Storage	Storage	Peak Hour		Approach	Intersection	Geometrics		Storage	Storage	Approach	Intersection	Geometrics		Storage		Storage	Approach	Intersection				
		Movement	# of Lanes	Length (Feet)	Length (Meters)	AM	PM	LOS (AM/PM)		LOS	Movement	# of Lanes	Length (Feet)	Length (Meters)		LOS (AM/PM)	LOS	Movement		# of Lanes	Length (Feet)		Length (Meters)	LOS (AM/PM)	LOS	
? Proton Drive Addison / Farmers Branch	Eastbound	Left	0.5	N/A	N/A	90	107	C/F	AM Peak LOS C, Delay = 19.6 sec/veh, w/c = 0.77	Left	0.5	N/A	N/A	C/C	AM Peak LOS C, Delay = 17.1 sec/veh, w/c = 0.77	Left	0.5	N/A	N/A	C/C	AM Peak LOS C, Delay = 18.2 sec/veh, w/c = 0.75	Existing east/west phase has all movements running concurrently. Phasing changes were assumed for all alternatives. The Final Recommendation shows the results of maintaining the existing number of lanes with WB approach restriping, increasing the storage lengths, & signal timing and phasing changes.

The diagram illustrates the intersection layout with vehicle counts and queue lengths for each direction. For EB traffic, the total count is 848, with 482 vehicles in the left lane and 28 in the right lane. For WB traffic, the total count is 419, with 44 vehicles in the left lane and 228 in the right lane. For NB traffic, the total count is 451, with 22 vehicles in the left lane and 2846 in the right lane. For SB traffic, the total count is 2846, with 10 vehicles in the left lane, 28 in the through lane, 5 in the right lane, and 15 in the right lane. The diagram also shows queue lengths for each lane and the intersection as a whole.

The diagram illustrates the intersection layout with traffic flow directions and vehicle counts. For EB, the total count is 2465, with 14 vehicles in the left lane, 27 in the through lane, and 330 in the right lane. WB has a total of 129 vehicles, with 108 in the through lane and 21 in the right lane. NB has a total of 316 vehicles, with 103 in the left lane, 83 in the through lane, and 1249 in the right lane. SB has a total of 277 vehicles, with 6 in the left lane, 77 in the through lane, and 22 in the right lane. Spillback percentages are provided for each approach, with WB and NB showing high spillback in the left lane (61.1% and 81.3% respectively).
